## **Todo List**

### Member AK acquire lock (int, int, pthread t)

Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

### Member AK\_acquire\_lock (int, int, pthread\_t)

Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

#### Member AK\_archive\_log (int sig)

this function takes static filename to store the failed commands, create certain logic that would make the function to use dynamic filename (this is partly implemented inside AK\_get\_timestamp, but there is no logic that uses the last file when recovering - recovery.c)

{link} recovery.c function test

### Member AK execute commands (command \*, int)

Check multithreading, check if it's working correctly

Check multithreading, check if it's working correctly

#### Member AK execute commands (command \*, int)

Check multithreading, check if it's working correctly

Check multithreading, check if it's working correctly

### Member AK\_get\_timestamp ()

Think about this in the future when creating multiple binary recovery files. Implementation gives the timestamp, but is not used anywhere for now.

#### Member AK memory block hash (int)

The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

### Member AK\_memory\_block\_hash (int)

The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

2 Todo List

### Member AK\_sort\_segment (char \*srcTable, char \*destTable, struct list\_node \*attributes)

Make it to suport multiple sort atributes and ASC|DESC ordering  $\,$ 

Make it to suport multiple sort atributes and ASC|DESC ordering

### 3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

_dictionary_	
Dictionary object	15
_file_metadata	16
_notifyDetails	17
AK_agg_input	
Structure that contains attributes from table header, tasks for this table and counter value	18
AK_agg_value	
Structure that contains atribute name, date and aggregation task associated	19
AK_block	
Structure that defines a block of data inside a DB file. It contains address, type, chained_with,	
AK_free space, last_tuple_dict_id, header and tuple_dict and data	20
AK_block_activity	
Structure which holds information about each block, whether it is locked for reading or writing. It is important to note such information, to enable quick and thread-safe reading from or writing to disk. Structure contains of: locked_for_reading - thread which locks particular block for reading will set this value locked_for_writing - thread which locks particular block for writing will set this value block_lock - each reading and writing operation will be done atomically and uninteruptable, using this mutex block lock reading_done - represents signal, which sends thread that just finished reading block. This signal will indicate that writing thread can start writing to block writing_done - represents signal, which sends thread that just finished writing to block. This signal will indicate that other threads can start reading from this block or even writing to it thread_holding_lock - the only thread which can unlock locked "block_lock" is the one that locked it. This variable makes sure that ONLY the thread, which actually holds the lock, releases it	22 24
AK command recovery struct	
Recovery structure used to recover commands from binary file	25
AK_command_struct	26
AK_create_table_struct	27
AK_db_cache	
Structure that defines global cache memory	28
AK_debmod_state	
Global structure that holds all relevant information for the debug mode and related functionality	29
AK_header	
Structure that represents header structure of blocks (describes an attribute inside an object). It	
contains type, attribute name, integrity, constraint name and constraint code	32

6 Class Index

AK_mem_block	
Structure that defines a block of data in memory	33
AK operand	35
AK_query_mem	-
Structure that defines global query memory	35
	33
AK_query_mem_dict	
Structure that defines global query memory for data dictionaries	37
AK_query_mem_lib	
Structure that defines global query memory for libraries	38
AK_query_mem_result	
Structure that defines global query memory for results	39
AK redo log	
Structure that defines global redo log	40
AK ref item	
— — — — — — — — — — — — — — — — — — —	
Structure that represents reference item. It contains of table, attributes, parent table and it's	44
attributes, number of attributes, constraint and type of reference	41
AK_results	
Structure used for in-memory result caching	42
AK_synchronization_info	
Structure for managing the synchronization between multiple threads accessing the same re-	
sources (essentially a mutex)	44
AK_tuple_dict	
Structure that defines a mapping in a header of an object to the actual entries (data). It contains	
type, address and size	45
blocktable	
	46
Structure that defines bit status of blocks, last initialized and last allocated index	
btree_node	46
bucket_elem	
Structure for defining a single bucket element	47
cost_eval_t	
Stucture for cost estimation on relations. It contains value (number of rows in table) and data	
(used to store table name)	48
DEBUG LEVEL	
Structure for setting debug level. Divide debug information according to their importance. More	
levels can be defined in the enum if needed. Each debug level can be easily excluded from	
output by setting corresponding enum element to 0	49
DEBUG TYPE	40
<del>-</del>	
Structure for setting debug type. Divide debug information according to their type (e.g. DB	
modules). More modules can be aditional added to the enum. Each debug type can be easly	
excluded from output by setting corresponding enum element to 0	49
drop_arguments	50
hash_bucket	
Structure for hash bucket for table hashing	50
hash info	
Structure for defining a hash info element	51
intersect attr	•
Structure defines intersect attribute	52
	52
list_node	
Structure defines a list node	53
list_structure_ad	55
list_structure_add	
Structure that defines linked list node for index	56
main bucket	
Structure for defining main bucket for table hashing	57
memoryAddresses	
Structure that represents a linked list of locked addresses	57
Observable	0,
	E0
Structure that defines the functions for observable object	58

3.1 Class List 7

observable_transaction	
Structure which defines transaction observable type	60
observable_transaction_struct	61
Observer	
Structure that defines the functions for observer object	62
observer_lock	
Structure which defines transaction lock observer type	63
projection_att_struct	
Structure that defines projection_att which is a new list_node	64
PtrContainer	65
root_info	65
rowroot_struct	
Structure that defines a new row in table using list_node	66
search_params	
Structure that contains attribute name, lower and upper data value, special(NULL or *) which is	
input for AK_equisearch_unsorted and AK_rangesearch_unsorted	66
search_result	
Structure which represents search result of AK equisearch unsorted and AK rangesearch $\leftrightarrow$	
unsorted	68
Stack	
Structure defines a Stack element. Every Stack has its Vertex pointer and pointer to next Stack	
in the linked list	70
struct add	
Structure defining node address	70
Succesor	
Structure defines a Succesor element. Every Succesor has its Vertex pointer and pointer to next	
Succesor in the linked list	71
table addresses	
Structure that defines start and end address of extent	72
TestResult	
Used so tests can report the amount of successful tests	73
threadContainer	
Structure that represents a linked list of threads.	
74	
transaction_list_elem	
Structure that represents LockTable entry about transaction lock holder. Element indexed by Hash	
table	75
transaction_list_head	,,
Structure that represents LockTable entry about doubly linked list of collision in Hash table	77
transaction_locks_list_elem	• • •
Structure that represents LockTable entry about transaction resource lock	77
transactionData	
Structure used to transport transaction data to the thread	79
TypeObservable	79
TypeObserver	81
Vertex	01
Structure defines a Vertex node element. Every Vertex has its VertexId, index, lowLink and	
nointer to next edge and vertex	81

# **Namespace Documentation**

### 5.1 comments Namespace Reference

### **Functions**

• def getcommentsFiles ()

This function is searching for file that ends with either .py extension or .c extension and appending the same in constant cFiles/pyFiles.

• def detectLanguage ()

Function is detecting language (is it croatian or alike) of a newly created commentsFile.

• def makeCommentsFile ()

Function is parsing comments from file with .c extension and .py extension.

### **Variables**

- string commentsFile = "all\_comments.tmp"
- list cFiles = []
- list pyFiles = []

### 5.1.1 Function Documentation

### 5.1.1.1 detectLanguage()

```
def comments.detectLanguage ( )
```

Function is detecting language (is it croatian or alike) of a newly created commentsFile.

### 5.1.1.2 getcommentsFiles()

```
def comments.getcommentsFiles ( )
```

This function is searching for file that ends with either .py extension or .c extension and appending the same in constant cFiles/pyFiles.

### 5.1.1.3 makeCommentsFile()

```
def comments.makeCommentsFile ( )
```

Function is parsing comments from file with .c extension and .py extension.

### 5.1.2 Variable Documentation

### 5.1.2.1 cFiles

```
list comments.cFiles = []
```

### 5.1.2.2 commentsFile

```
string comments.commentsFile = "all_comments.tmp"
```

### 5.1.2.3 pyFiles

```
list comments.pyFiles = []
```

## **Class Documentation**

### 6.1 \_dictionary\_ Struct Reference

Dictionary object.

#include <dictionary.h>

### **Public Attributes**

- int n
- int size
- char \*\* val
- char \*\* key
- unsigned \* hash

### 6.1.1 Detailed Description

Dictionary object.

This object contains a list of string/string associations. Each association is identified by a unique string key. Looking up values in the dictionary is speeded up by the use of a (hopefully collision-AK\_free) hash function.

### 6.1.2 Member Data Documentation

### 6.1.2.1 hash

unsigned\* \_dictionary\_::hash

List of string keys

16 Class Documentation

### 6.1.2.2 key

```
char** _dictionary_::key
```

List of string values

### 6.1.2.3 n

```
int _dictionary_::n
```

### 6.1.2.4 size

```
int _dictionary_::size
```

Number of entries in dictionary

### 6.1.2.5 val

```
char** _dictionary_::val
```

Storage size

The documentation for this struct was generated from the following file:

· auxi/dictionary.h

## 6.2 \_file\_metadata Struct Reference

```
#include <blobs.h>
```

### **Public Attributes**

- char \* new\_path
- char \* new\_name
- char \* old\_path
- char \* old\_name
- char \* checksum

### 6.2.1 Member Data Documentation

### 6.2.1.1 checksum

char\* \_file\_metadata::checksum

### 6.2.1.2 new\_name

char\* \_file\_metadata::new\_name

### 6.2.1.3 new\_path

char\* \_file\_metadata::new\_path

### 6.2.1.4 old\_name

char\* \_file\_metadata::old\_name

### 6.2.1.5 old\_path

char\* \_file\_metadata::old\_path

The documentation for this struct was generated from the following file:

• file/blobs.h

## 6.3 \_notifyDetails Struct Reference

### **Public Attributes**

- char \* message
- NotifyType type

### 6.3.1 Member Data Documentation

18 Class Documentation

### 6.3.1.1 message

char\* \_notifyDetails::message

### 6.3.1.2 type

```
NotifyType _notifyDetails::type
```

The documentation for this struct was generated from the following file:

• auxi/observable.c

## 6.4 AK\_agg\_input Struct Reference

Structure that contains attributes from table header, tasks for this table and counter value.

```
#include <aggregation.h>
```

Collaboration diagram for AK\_agg\_input:

### **Public Attributes**

- AK\_header attributes [MAX\_ATTRIBUTES]
- int tasks [MAX\_ATTRIBUTES]
- · int counter

### 6.4.1 Detailed Description

Structure that contains attributes from table header, tasks for this table and counter value.

**Author** 

Unknown

### 6.4.2 Member Data Documentation

### 6.4.2.1 attributes

AK\_header AK\_agg\_input::attributes[MAX\_ATTRIBUTES]

#### 6.4.2.2 counter

int AK\_agg\_input::counter

#### 6.4.2.3 tasks

```
int AK_agg_input::tasks[MAX_ATTRIBUTES]
```

The documentation for this struct was generated from the following file:

· rel/aggregation.h

# 6.5 AK\_agg\_value Struct Reference

Structure that contains atribute name, date and aggregation task associated.

#include <aggregation.h>

## **Public Attributes**

- char att\_name [MAX\_ATT\_NAME]
- char data [MAX\_VARCHAR\_LENGTH]
- int agg\_task

## 6.5.1 Detailed Description

Structure that contains atribute name, date and aggregation task associated.

Author

Unknown

## 6.5.2 Member Data Documentation

## 6.5.2.1 agg\_task

int AK\_agg\_value::agg\_task

#### 6.5.2.2 att\_name

```
char AK_agg_value::att_name[MAX_ATT_NAME]
```

#### 6.5.2.3 data

```
char AK_agg_value::data[MAX_VARCHAR_LENGTH]
```

The documentation for this struct was generated from the following file:

· rel/aggregation.h

# 6.6 AK\_block Struct Reference

Structure that defines a block of data inside a DB file. It contains address, type, chained\_with, AK\_free space, last\_tuple\_dict\_id, header and tuple\_dict and data.

```
#include <dbman.h>
```

Collaboration diagram for AK\_block:

#### **Public Attributes**

· int address

block number (address) in DB file

int type

block type (can be BLOCK\_TYPE\_FREE, BLOCK\_TYPE\_NORMAL or BLOCK\_TYPE\_CHAINED)

· int chained\_with

address of chained block; NOT\_CHAINED otherwise

• int AK\_free\_space

AK\_free space in block.

- · int last\_tuple\_dict\_id
- AK\_header header [MAX\_ATTRIBUTES]

attribute definitions

AK\_tuple\_dict tuple\_dict [DATA\_BLOCK\_SIZE]

dictionary of data entries

unsigned char data [DATA\_BLOCK\_SIZE \*DATA\_ENTRY\_SIZE]

actual data entries

## 6.6.1 Detailed Description

Structure that defines a block of data inside a DB file. It contains address, type, chained\_with, AK\_free space, last\_tuple\_dict\_id, header and tuple\_dict and data.

Author

Markus Schatten

## 6.6.2 Member Data Documentation

#### 6.6.2.1 address

int AK\_block::address

block number (address) in DB file

## 6.6.2.2 AK\_free\_space

int AK\_block::AK\_free\_space

AK\_free space in block.

#### 6.6.2.3 chained\_with

int AK\_block::chained\_with

address of chained block; NOT\_CHAINED otherwise

## 6.6.2.4 data

unsigned char AK\_block::data[DATA\_BLOCK\_SIZE \*DATA\_ENTRY\_SIZE]

actual data entries

#### 6.6.2.5 header

AK\_header AK\_block::header[MAX\_ATTRIBUTES]

attribute definitions

## 6.6.2.6 last\_tuple\_dict\_id

int AK\_block::last\_tuple\_dict\_id

#### 6.6.2.7 tuple\_dict

```
AK_tuple_dict AK_block::tuple_dict[DATA_BLOCK_SIZE]
```

dictionary of data entries

#### 6.6.2.8 type

```
int AK_block::type
```

block type (can be BLOCK\_TYPE\_FREE, BLOCK\_TYPE\_NORMAL or BLOCK\_TYPE\_CHAINED)

The documentation for this struct was generated from the following file:

· dm/dbman.h

# 6.7 AK\_block\_activity Struct Reference

Structure which holds information about each block, whether it is locked for reading or writing. It is important to note such information, to enable quick and thread-safe reading from or writing to disk. Structure contains of: locked — for\_reading - thread which locks particular block for reading will set this value locked\_for\_writing - thread which locks particular block for writing will set this value block\_lock - each reading and writing operation will be done atomically and uninteruptable, using this mutex block lock reading\_done - represents signal, which sends thread that just finished reading block. This signal will indicate that writing thread can start writing to block writing\_done - represents signal, which sends thread that just finished writing to block. This signal will indicate that other threads can start reading from this block or even writing to it thread\_holding\_lock - the only thread which can unlock locked "block\_lock" is the one that locked it. This variable makes sure that ONLY the thread, which actually holds the lock, releases it.

#include <dbman.h>

## **Public Attributes**

- · short locked for reading
- · short locked\_for\_writing
- pthread\_mutex\_t block\_lock
- pthread\_cond\_t writing\_done
- pthread\_cond\_t reading\_done
- int \* thread\_holding\_lock

## 6.7.1 Detailed Description

Structure which holds information about each block, whether it is locked for reading or writing. It is important to note such information, to enable quick and thread-safe reading from or writing to disk. Structure contains of: locked for\_reading - thread which locks particular block for reading will set this value locked\_for\_writing - thread which locks particular block for writing will set this value block\_lock - each reading and writing operation will be done atomically and uninteruptable, using this mutex block lock reading\_done - represents signal, which sends thread that just finished reading block. This signal will indicate that writing thread can start writing to block writing\_done - represents signal, which sends thread that just finished writing to block. This signal will indicate that other threads can start reading from this block or even writing to it thread\_holding\_lock - the only thread which can unlock locked "block\_lock" is the one that locked it. This variable makes sure that ONLY the thread, which actually holds the lock, releases it.

**Author** 

Domagoj Šitum

#### 6.7.2 Member Data Documentation

- char arguments [MAX\_ATTRIBUTES][MAX\_VARCHAR\_LENGTH]
- char condition [MAX\_ATTRIBUTES][MAX\_VARCHAR\_LENGTH]
- · int finished

## 6.9.1 Detailed Description

recovery structure used to recover commands from binary file

Structure that contains all vital information for the command that is about to execute. It is defined by the operation (INSERT, UPDATE, DELETE that are defined inside the const.c file), table where the data is stored, and certain data that will be stored. Updated can be used to save select operation

Author

Tomislav Turek updated by Danko Bukovac

## 6.9.2 Member Data Documentation

# 6.21 AK\_redo\_log Struct Reference

Structure that defines global redo log.

#include <memoman.h>

Collaboration diagram for AK\_redo\_log:

#### **Public Attributes**

- AK\_command\_recovery\_struct command\_recovery [MAX\_REDO\_LOG\_ENTRIES]
- · int number

## 6.21.1 Detailed Description

Structure that defines global redo log.

The structure defines an array of commands being executed at the moment. If and when commands fail to execute, the rest of the commands that did not execute will be stored inside a binary file and the system will try recovery and execution for those commands. With the array, we also store a number that defines the number of commands that failed to execute (length of command\_recovery array).

Author

Dražen Bandić, updated by Tomislav Turek

#### 6.21.2 Member Data Documentation

#### 6.37.1.3 next

```
struct list_structure_ad* list_structure_ad::next
```

next node pointer

The documentation for this struct was generated from the following file:

• file/idx/index.h

# 6.38 list\_structure\_add Struct Reference

Structure that defines linked list node for index.

```
#include <index.h>
```

### 6.38.1 Detailed Description

Structure that defines linked list node for index.

The documentation for this struct was generated from the following file:

• file/idx/index.h

# 6.39 main\_bucket Struct Reference

Structure for defining main bucket for table hashing.

```
#include <hash.h>
```

Collaboration diagram for main\_bucket:

#### **Public Attributes**

bucket\_elem element [MAIN\_BUCKET\_SIZE]
 main bucket array of bucket\_elem elements

### 6.39.1 Detailed Description

Structure for defining main bucket for table hashing.

Author

Unknown

### 6.39.2 Member Data Documentation

#### 6.39.2.1 element

```
bucket_elem main_bucket::element[MAIN_BUCKET_SIZE]
```

main bucket array of bucket\_elem elements

The documentation for this struct was generated from the following file:

• file/idx/hash.h

# 6.40 memoryAddresses Struct Reference

Structure that represents a linked list of locked addresses.

```
#include <transaction.h>
```

Collaboration diagram for memoryAddresses:

#### **Public Attributes**

- int adresa
- struct memoryAddresses \* nextElement

### 6.40.1 Detailed Description

Structure that represents a linked list of locked addresses.

Author

Frane Jakelić

#### 6.40.2 Member Data Documentation

#### 6.40.2.1 adresa

int memoryAddresses::adresa

#### 6.40.2.2 nextElement

```
struct memoryAddresses* memoryAddresses::nextElement
```

The documentation for this struct was generated from the following file:

· trans/transaction.h

#### 6.41 Observable Struct Reference

Structure that defines the functions for observable object.

```
#include <observable.h>
```

Collaboration diagram for Observable:

#### **Public Attributes**

- AK\_observer \* observers [MAX\_OBSERVABLE\_OBSERVERS]
- int observer\_id\_counter
- void \* AK\_observable\_type
- int AK\_ObservableType\_Def
- int(\* AK\_destroy\_observable )(struct Observable \*)
- int(\* AK\_register\_observer)(struct Observable \*, AK\_observer \*)
- int(\* AK\_unregister\_observer )(struct Observable \*, AK\_observer \*)
- int(\* AK\_notify\_observer)(struct Observable \*, AK\_observer \*)
- int(\* AK\_notify\_observers )(struct Observable \*)
- int(\* AK\_run\_custom\_action )(void \*)
- AK\_observer \*(\* AK\_get\_observer\_by\_id )(struct Observable \*, int id)

### 6.41.1 Detailed Description

Structure that defines the functions for observable object.

**Author** 

Ivan Pusic

#### 6.41.2 Member Data Documentation

### 6.41.2.1 AK\_destroy\_observable

```
int(* Observable::AK_destroy_observable) (struct Observable *)
```

#### 6.41.2.2 AK\_get\_observer\_by\_id

```
AK_observer*(* Observable::AK_get_observer_by_id) (struct Observable *, int id)
```

#### 6.41.2.3 AK\_notify\_observer

```
int(* Observable::AK_notify_observer) (struct Observable *, AK_observer *)
```

### 6.41.2.4 AK\_notify\_observers

```
int(* Observable::AK_notify_observers) (struct Observable *)
```

#### 6.41.2.5 AK\_observable\_type

void\* Observable::AK\_observable\_type

### 6.41.2.6 AK\_ObservableType\_Def

int Observable::AK\_ObservableType\_Def

### 6.41.2.7 AK\_register\_observer

```
int(* Observable::AK_register_observer) (struct Observable *, AK_observer *)
```

### 6.41.2.8 AK\_run\_custom\_action

```
int(* Observable::AK_run_custom_action) (void *)
```

#### 6.41.2.9 AK\_unregister\_observer

```
int(* Observable::AK_unregister_observer) (struct Observable *, AK_observer *)
```

#### 6.41.2.10 observer id counter

int Observable::observer\_id\_counter

### 6.41.2.11 observers

AK\_observer\* Observable::observers[MAX\_OBSERVABLE\_OBSERVERS]

The documentation for this struct was generated from the following file:

• auxi/observable.h

# 6.42 observable\_transaction Struct Reference

Structure which defines transaction observable type.

```
#include <transaction.h>
```

### 6.42.1 Detailed Description

Structure which defines transaction observable type.

Author

Ivan Pusic

The documentation for this struct was generated from the following file:

• trans/transaction.h

### 6.43 observable\_transaction\_struct Struct Reference

```
#include <transaction.h>
```

Collaboration diagram for observable\_transaction\_struct:

#### **Public Attributes**

- int(\* AK\_transaction\_register\_observer )(struct observable\_transaction\_struct \*, AK\_observer \*)
- int(\* AK\_transaction\_unregister\_observer )(struct observable\_transaction\_struct \*, AK\_observer \*)
- void(\* AK\_lock\_released )()
- void(\* AK transaction finished)()
- void(\* AK\_all\_transactions\_finished )()
- AK\_observable \* observable

#### 6.43.1 Member Data Documentation

#### 6.43.1.1 AK\_all\_transactions\_finished

```
void(* observable_transaction_struct::AK_all_transactions_finished) ()
```

#### 6.43.1.2 AK\_lock\_released

```
void(* observable_transaction_struct::AK_lock_released) ()
```

#### 6.43.1.3 AK\_transaction\_finished

```
void(* observable_transaction_struct::AK_transaction_finished) ()
```

#### 6.43.1.4 AK\_transaction\_register\_observer

```
int(* observable_transaction_struct::AK_transaction_register_observer) (struct observable_transaction_struct
*, AK_observer *)
```

#### 6.43.1.5 AK\_transaction\_unregister\_observer

int(\* observable\_transaction\_struct::AK\_transaction\_unregister\_observer) (struct observable\_transaction\_struct
\*, AK\_observer \*)

#### 6.43.1.6 observable

```
AK_observable* observable_transaction_struct::observable
```

The documentation for this struct was generated from the following file:

· trans/transaction.h

### 6.44 Observer Struct Reference

Structure that defines the functions for observer object.

```
#include <observable.h>
```

#### **Public Attributes**

- · int observer id
- void \* AK\_observer\_type
- void(\* AK\_observer\_type\_event\_handler )(void \*, void \*, AK\_ObservableType\_Enum)
- int(\* AK\_notify)(struct Observer \*, void \*observable\_type, AK\_ObservableType\_Enum)
- int(\* AK\_destroy\_observer )(struct Observer \*)

### 6.44.1 Detailed Description

Structure that defines the functions for observer object.

Author

Ivan Pusic

### 6.44.2 Member Data Documentation

### 6.44.2.1 AK\_destroy\_observer

```
int(* Observer::AK_destroy_observer) (struct Observer *)
```

### 6.44.2.2 AK\_notify

```
int(* Observer::AK_notify) (struct Observer *, void *observable_type, AK_ObservableType_Enum)
```

#### 6.44.2.3 AK\_observer\_type

void\* Observer::AK\_observer\_type

### 6.44.2.4 AK\_observer\_type\_event\_handler

void(\* Observer::AK\_observer\_type\_event\_handler) (void \*, void \*, AK\_ObservableType\_Enum)

### 6.44.2.5 observer\_id

int Observer::observer\_id

The documentation for this struct was generated from the following file:

· auxi/observable.h

# 6.45 observer\_lock Struct Reference

Structure which defines transaction lock observer type.

```
#include <transaction.h>
```

Collaboration diagram for observer\_lock:

### **Public Attributes**

• AK\_observer \* observer

### 6.45.1 Detailed Description

Structure which defines transaction lock observer type.

Author

Ivan Pusic

### 6.45.2 Member Data Documentation

#### 6.45.2.1 observer

```
AK_observer* observer_lock::observer
```

The documentation for this struct was generated from the following file:

• trans/transaction.h

# 6.46 projection\_att\_struct Struct Reference

Structure that defines projection\_att which is a new list\_node.

```
#include <aggregation.h>
```

Collaboration diagram for projection\_att\_struct:

### **Public Attributes**

struct list\_node \* projection\_att

### 6.46.1 Detailed Description

Structure that defines projection\_att which is a new list\_node.

Author

Ena Dujak

### 6.46.2 Member Data Documentation

#### 6.46.2.1 projection\_att

```
struct list_node* projection_att_struct::projection_att
```

The documentation for this struct was generated from the following file:

• rel/aggregation.h

### 6.47 PtrContainer Struct Reference

#include <ptrcontainer.h>

#### **Public Attributes**

void \* ptr

#### 6.47.1 Member Data Documentation

#### 6.47.1.1 ptr

void\* PtrContainer::ptr

The documentation for this struct was generated from the following file:

· auxi/ptrcontainer.h

# 6.48 root\_info Struct Reference

#include <btree.h>

### **Public Attributes**

- int root
- int level [ORDER]

### 6.48.1 Member Data Documentation

### 6.48.1.1 level

int root\_info::level[ORDER]

#### 6.48.1.2 root

```
int root_info::root
```

The documentation for this struct was generated from the following file:

file/idx/btree.h

### 6.49 rowroot struct Struct Reference

Structure that defines a new row in table using list\_node.

```
#include <aggregation.h>
```

Collaboration diagram for rowroot\_struct:

#### **Public Attributes**

struct list node \* row root

### 6.49.1 Detailed Description

Structure that defines a new row in table using list\_node.

Author

Ena Dujak

#### 6.49.2 Member Data Documentation

```
6.49.2.1 row_root
```

```
struct list_node* rowroot_struct::row_root
```

The documentation for this struct was generated from the following file:

· rel/aggregation.h

# 6.50 search\_params Struct Reference

Structure that contains attribute name, lower and upper data value, special(NULL or \*) which is input for AK $_{\leftarrow}$  equisearch\_unsorted and AK\_rangesearch\_unsorted.

```
#include <filesearch.h>
```

#### **Public Attributes**

char \* szAttribute

name of attribute

void \* pData lower

pointer to lower value of search range

void \* pData\_upper

pointer to upper value of search range

int iSearchType

if searching for NULL values, set to SEARCH\_NULL, all values -> SEARCH\_ALL, particular value -> SEARCH\_← PARTICULAR, range of values -> SEARCH\_RANGE

### 6.50.1 Detailed Description

Structure that contains attribute name, lower and upper data value, special(NULL or \*) which is input for AK\_\circ equisearch unsorted and AK rangesearch unsorted.

**Author** 

Unknown

#### 6.50.2 Member Data Documentation

#### 6.50.2.1 iSearchType

int search\_params::iSearchType

if searching for NULL values, set to SEARCH\_NULL, all values -> SEARCH\_ALL, particular value -> SEARCH $\leftarrow$  \_PARTICULAR, range of values -> SEARCH\_RANGE

#### 6.50.2.2 pData lower

void\* search\_params::pData\_lower

pointer to lower value of search range

#### 6.50.2.3 pData\_upper

void\* search\_params::pData\_upper

pointer to upper value of search range

#### 6.50.2.4 szAttribute

```
char* search_params::szAttribute
```

name of attribute

The documentation for this struct was generated from the following file:

• file/filesearch.h

# 6.51 search\_result Struct Reference

Structure which represents search result of AK\_equisearch\_unsorted and AK\_rangesearch\_unsorted.

```
#include <filesearch.h>
```

#### **Public Attributes**

• int \* aiTuple\_addresses

array of tuple addresses

int \* aiBlocks

array of blocks to which the tuple addresses are relative

• int iNum\_tuple\_addresses

number of tuple addresses/blocks in corresponding arrays

int \* aiSearch\_attributes

array of indexes of searched-for attributes

• int iNum\_search\_attributes

number of searched-for attributes in array

int iNum\_tuple\_attributes

number of attributes in tuple

### 6.51.1 Detailed Description

Structure which represents search result of AK\_equisearch\_unsorted and AK\_rangesearch\_unsorted.

Author

Unknown

### 6.51.2 Member Data Documentation

#### 6.51.2.1 aiBlocks

```
int* search_result::aiBlocks
```

array of blocks to which the tuple addresses are relative

### 6.51.2.2 aiSearch\_attributes

```
int* search_result::aiSearch_attributes
```

array of indexes of searched-for attributes

### 6.51.2.3 aiTuple\_addresses

```
int* search_result::aiTuple_addresses
```

array of tuple addresses

#### 6.51.2.4 iNum\_search\_attributes

```
int search_result::iNum_search_attributes
```

number of searched-for attributes in array

### 6.51.2.5 iNum\_tuple\_addresses

```
int search_result::iNum_tuple_addresses
```

number of tuple addresses/blocks in corresponding arrays

### 6.51.2.6 iNum\_tuple\_attributes

```
int search_result::iNum_tuple_attributes
```

number of attributes in tuple

The documentation for this struct was generated from the following file:

· file/filesearch.h

### 6.52 Stack Struct Reference

Structure defines a Stack element. Every Stack has its Vertex pointer and pointer to next Stack in the linked list.

```
#include <auxiliary.h>
```

Collaboration diagram for Stack:

### **Public Attributes**

- struct Vertex \* link
- struct Stack \* nextElement

### 6.52.1 Detailed Description

Structure defines a Stack element. Every Stack has its Vertex pointer and pointer to next Stack in the linked list.

Author

Frane Jakelić

#### 6.52.2 Member Data Documentation

#### 6.52.2.1 link

```
struct Vertex* Stack::link
```

#### 6.52.2.2 nextElement

```
struct Stack* Stack::nextElement
```

The documentation for this struct was generated from the following file:

• auxi/auxiliary.h

# 6.53 struct\_add Struct Reference

Structure defining node address.

```
#include <index.h>
```

### **Public Attributes**

• int addBlock

block address

int indexTd

index table destination

### 6.53.1 Detailed Description

Structure defining node address.

**Author** 

Unknown

#### 6.53.2 Member Data Documentation

#### 6.53.2.1 addBlock

int struct\_add::addBlock

block address

#### 6.53.2.2 indexTd

int struct\_add::indexTd

index table destination

The documentation for this struct was generated from the following file:

• file/idx/index.h

### 6.54 Succesor Struct Reference

Structure defines a Succesor element. Every Succesor has its Vertex pointer and pointer to next Succesor in the linked list.

#include <auxiliary.h>

Collaboration diagram for Succesor:

### **Public Attributes**

- struct Vertex \* link
- struct Succesor \* nextSuccesor

### 6.54.1 Detailed Description

Structure defines a Succesor element. Every Succesor has its Vertex pointer and pointer to next Succesor in the linked list.

**Author** 

Frane Jakelić

#### 6.54.2 Member Data Documentation

### 6.54.2.1 link

```
struct Vertex* Succesor::link
```

#### 6.54.2.2 nextSuccesor

```
struct Succesor* Succesor::nextSuccesor
```

The documentation for this struct was generated from the following file:

· auxi/auxiliary.h

### 6.55 table addresses Struct Reference

Structure that defines start and end address of extent.

```
#include <dbman.h>
```

#### **Public Attributes**

- int address\_from [MAX\_EXTENTS\_IN\_SEGMENT] sturcture for extents start end stop adresses
- int address\_to [MAX\_EXTENTS\_IN\_SEGMENT]

### 6.55.1 Detailed Description

Structure that defines start and end address of extent.

**Author** 

Matija Novak

### 6.55.2 Member Data Documentation

### 6.55.2.1 address\_from

```
int table_addresses::address_from[MAX_EXTENTS_IN_SEGMENT]
```

sturcture for extents start end stop adresses

#### 6.55.2.2 address\_to

```
int table_addresses::address_to[MAX_EXTENTS_IN_SEGMENT]
```

The documentation for this struct was generated from the following file:

• dm/dbman.h

### 6.56 TestResult Struct Reference

Used so tests can report the amount of successful tests.

```
#include <test.h>
```

#### **Public Attributes**

- · int testSucceded
- · int testFailed
- · char implemented

### 6.56.1 Detailed Description

Used so tests can report the amount of successful tests.

This structure is used so tests can report the amount of successful tests.

Author

Igor Rinkovec

### 6.56.2 Member Data Documentation

#### 6.56.2.1 implemented

char TestResult::implemented

#### 6.56.2.2 testFailed

int TestResult::testFailed

#### 6.56.2.3 testSucceded

int TestResult::testSucceded

The documentation for this struct was generated from the following file:

· auxi/test.h

### 6.57 threadContainer Struct Reference

Structure that represents a linked list of threads.

#include <transaction.h>

Collaboration diagram for threadContainer:

#### **Public Attributes**

- pthread\_t thread
- struct threadContainer \* nextThread

### 6.57.1 Detailed Description

Structure that represents a linked list of threads.

Author

Frane Jakelić

### 6.57.2 Member Data Documentation

#### 6.57.2.1 nextThread

struct threadContainer\* threadContainer::nextThread

#### 6.57.2.2 thread

pthread\_t threadContainer::thread

The documentation for this struct was generated from the following file:

· trans/transaction.h

### 6.58 transaction\_list\_elem Struct Reference

Structure that represents LockTable entry about transaction lock holder. Element indexed by Hash table.

#include <transaction.h>

 $Collaboration\ diagram\ for\ transaction\_list\_elem:$ 

### **Public Attributes**

- int address
- int lock\_type
- · int isWaiting
- struct transaction\_locks\_list\_elem \* DLLLocksHead
- struct transaction\_list\_elem \* nextBucket
- struct transaction\_list\_elem \* prevBucket
- AK\_observer\_lock \* observer\_lock

### 6.58.1 Detailed Description

Structure that represents LockTable entry about transaction lock holder. Element indexed by Hash table.

Author

Frane Jakelić

### 6.58.2 Member Data Documentation

#### 6.58.2.1 address

int transaction\_list\_elem::address

### 6.58.2.2 DLLLocksHead

 $\verb|struct transaction_locks_list_elem*| transaction_list_elem::DLLLocksHead|$ 

#### 6.58.2.3 isWaiting

int transaction\_list\_elem::isWaiting

#### 6.58.2.4 lock\_type

int transaction\_list\_elem::lock\_type

### 6.58.2.5 nextBucket

struct transaction\_list\_elem\* transaction\_list\_elem::nextBucket

### 6.58.2.6 observer\_lock

AK\_observer\_lock\* transaction\_list\_elem::observer\_lock

### 6.58.2.7 prevBucket

struct transaction\_list\_elem\* transaction\_list\_elem::prevBucket

The documentation for this struct was generated from the following file:

• trans/transaction.h

### 6.59 transaction list head Struct Reference

Structure that represents LockTable entry about doubly linked list of collision in Hash table.

```
#include <transaction.h>
```

Collaboration diagram for transaction\_list\_head:

#### **Public Attributes**

struct transaction\_list\_elem \* DLLHead

### 6.59.1 Detailed Description

Structure that represents LockTable entry about doubly linked list of collision in Hash table.

**Author** 

Frane Jakelić

### 6.59.2 Member Data Documentation

#### 6.59.2.1 DLLHead

```
struct transaction_list_elem* transaction_list_head::DLLHead
```

The documentation for this struct was generated from the following file:

· trans/transaction.h

# 6.60 transaction\_locks\_list\_elem Struct Reference

Structure that represents LockTable entry about transaction resource lock.

```
#include <transaction.h>
```

Collaboration diagram for transaction\_locks\_list\_elem:

### **Public Attributes**

- pthread\_t TransactionId
- · int lock\_type
- · int isWaiting
- struct transaction\_locks\_list\_elem \* nextLock
- struct transaction\_locks\_list\_elem \* prevLock

### 6.60.1 Detailed Description

Structure that represents LockTable entry about transaction resource lock.

**Author** 

Frane Jakelić

#### 6.60.2 Member Data Documentation

### 6.60.2.1 isWaiting

int transaction\_locks\_list\_elem::isWaiting

### 6.60.2.2 lock\_type

int transaction\_locks\_list\_elem::lock\_type

#### 6.60.2.3 nextLock

struct transaction\_locks\_list\_elem\* transaction\_locks\_list\_elem::nextLock

## 6.60.2.4 prevLock

 $\verb|struct transaction_locks_list_elem*| transaction_locks_list_elem*|:prevLock|$ 

#### 6.60.2.5 TransactionId

 $\verb|pthread_t transaction_locks_list_elem:: TransactionId|\\$ 

The documentation for this struct was generated from the following file:

• trans/transaction.h

### 6.61 transactionData Struct Reference

Structure used to transport transaction data to the thread.

```
#include <transaction.h>
```

Collaboration diagram for transactionData:

#### **Public Attributes**

- int lengthOfArray
- command \* array

### 6.61.1 Detailed Description

Structure used to transport transaction data to the thread.

**Author** 

Frane Jakelić

### 6.61.2 Member Data Documentation

### 6.61.2.1 array

command\* transactionData::array

### 6.61.2.2 lengthOfArray

int transactionData::lengthOfArray

The documentation for this struct was generated from the following file:

• trans/transaction.h

# 6.62 TypeObservable Struct Reference

Collaboration diagram for TypeObservable:

#### **Public Attributes**

- NotifyDetails \* notifyDetails
- char \*(\* AK\_get\_message )(struct TypeObservable \*)
- int(\* AK\_custom\_register\_observer )(struct TypeObservable \*, AK\_observer \*)
- int(\* AK\_custom\_unregister\_observer)(struct TypeObservable \*, AK\_observer \*)
- void(\* AK\_set\_notify\_info\_details )(struct TypeObservable \*, NotifyType type, char \*message)
- AK\_observable \* observable

#### 6.62.1 Member Data Documentation

#### 6.62.1.1 AK\_custom\_register\_observer

```
int(* TypeObservable::AK_custom_register_observer) (struct TypeObservable *, AK_observer *)
```

#### 6.62.1.2 AK\_custom\_unregister\_observer

```
int(* TypeObservable::AK_custom_unregister_observer) (struct TypeObservable *, AK_observer *)
```

#### 6.62.1.3 AK\_get\_message

```
\verb|char*(* TypeObservable::AK_get_message)| (struct TypeObservable *)|
```

### 6.62.1.4 AK\_set\_notify\_info\_details

```
void(* TypeObservable::AK_set_notify_info_details) (struct TypeObservable *, NotifyType type,
char *message)
```

#### 6.62.1.5 notifyDetails

NotifyDetails\* TypeObservable::notifyDetails

#### 6.62.1.6 observable

```
AK_observable* TypeObservable::observable
```

The documentation for this struct was generated from the following file:

· auxi/observable.c

# 6.63 TypeObserver Struct Reference

Collaboration diagram for TypeObserver:

#### **Public Attributes**

- AK\_TypeObservable \* observable
- AK\_observer \* observer

#### 6.63.1 Member Data Documentation

#### 6.63.1.1 observable

AK\_TypeObservable\* TypeObserver::observable

#### 6.63.1.2 observer

```
AK_observer* TypeObserver::observer
```

The documentation for this struct was generated from the following file:

• auxi/observable.c

### 6.64 Vertex Struct Reference

Structure defines a Vertex node element. Every Vertex has its VertexId, index, lowLink and pointer to next edge and vertex.

```
#include <auxiliary.h>
```

Collaboration diagram for Vertex:

### **Public Attributes**

- · int vertexId
- int index
- int lowLink
- struct Succesor \* nextSuccesor
- struct Vertex \* nextVertex

### 6.64.1 Detailed Description

Structure defines a Vertex node element. Every Vertex has its VertexId, index, lowLink and pointer to next edge and vertex.

Author

Frane Jakelić

#### 6.64.2 Member Data Documentation

#### 6.64.2.1 index

int Vertex::index

#### 6.64.2.2 lowLink

int Vertex::lowLink

#### 6.64.2.3 nextSuccesor

struct Succesor\* Vertex::nextSuccesor

### 6.64.2.4 nextVertex

struct Vertex\* Vertex::nextVertex

#### 6.64.2.5 vertexId

int Vertex::vertexId

The documentation for this struct was generated from the following file:

· auxi/auxiliary.h

# **Chapter 7**

# **File Documentation**

# 7.1 auxi/auxiliary.c File Reference

```
#include "auxiliary.h"
Include dependency graph for auxiliary.c:
```

# 7.2 auxi/auxiliary.h File Reference

```
#include "constants.h"
#include "configuration.h"
#include "test.h"
#include "assert.h"
#include "time.h"
#include "string.h"
#include "ctype.h"
#include "debug.h"
#include "mempro.h"
```

Include dependency graph for auxiliary.h: This graph shows which files directly or indirectly include this file:

### **Classes**

struct list\_node

Structure defines a list node.

struct Vertex

Structure defines a Vertex node element. Every Vertex has its VertexId, index, lowLink and pointer to next edge and vertex.

struct Succesor

Structure defines a Succesor element. Every Succesor has its Vertex pointer and pointer to next Succesor in the linked list.

· struct Stack

Structure defines a Stack element. Every Stack has its Vertex pointer and pointer to next Stack in the linked list.

• struct AK\_synchronization\_info

Structure for managing the synchronization between multiple threads accessing the same resources (essentially a mutex).

84 File Documentation

#### **Macros**

- #define MAX\_LOOP\_ITERATIONS 1000
- #define TBL BOX OFFSET 1

### **Typedefs**

- typedef struct list\_node AK\_list
- typedef struct list node \* AK list elem
- · typedef struct Vertex AK graph
- typedef struct Succesor \* AK succesor
- typedef struct Vertex \* AK\_vertex
- typedef struct Stack \* AK\_stack
- typedef struct Stack AK\_stackHead

#### **Functions**

char \* AK\_convert\_type (char \*arg\_type)

Function that change type of argument from string to integer.

int AK\_strcmp (const void \*a, const void \*b)

Function compares two Strings.

void AK\_define\_tarjan\_graph ()

Function for creating graph for testing tarjan algorithm.

• int AK\_chars\_num\_from\_number (int number, int base)

Function that gets the number of digits for any given number.

• size\_t AK\_type\_size (int iDB\_type, char \*szVarchar)

Function returns the size in bytes for the provided database type.

void AK\_Init\_L3 (struct list\_node \*\*L)

Function that initializes an empty list.

struct list\_node \* AK\_First\_L2 (struct list\_node \*L)

Function that fetches the first element of the list.

struct list\_node \* AK\_End\_L2 (struct list\_node \*L)

Function that fetches the last element of the list.

struct list\_node \* AK\_Next\_L2 (struct list\_node \*current)

Function that fetches the next element of the list.

• struct list\_node \* AK\_Previous\_L2 (struct list\_node \*current, struct list\_node \*L)

Function that fetches the previous element of the list.

unsigned int AK\_IsEmpty\_L2 (struct list\_node \*L)

Function that tests if the list is empty.

- void AK\_InsertBefore\_L2 (int type, char \*data, int size, struct list\_node \*\*current, struct list\_node \*\*L)

  Function that inserts a new element before the current element of the list.
- void AK\_InsertAfter\_L2 (int type, char \*data, int size, struct list\_node \*\*current, struct list\_node \*\*L)
   Function that inserts a new element after the current element of the list.

void AK InsertAtBegin L3 (int type, char \*data, int size, struct list node \*L)

Function that inserts a new element at the beginning of the list. It uses function called: AK\_InsertBefore\_L.

void AK\_InsertAtEnd\_L3 (int type, char \*data, int size, struct list\_node \*L)

Function that inserts a new element at the end of the list. It uses a function called: AK\_InsertAfter\_L2.

void AK Delete L3 (struct list node \*\*current, struct list node \*\*L)

Function that deletes the current element of the list.

void AK\_DeleteAll\_L3 (struct list\_node \*\*L)

Function that empties the list.

int AK\_Size\_L2 (struct list\_node \*L)

Function that fetches the number of the elements in the list.

char \* AK Retrieve L2 (struct list node \*current, struct list node \*L)

Function that retrieves the data from the current element of the list.

struct list\_node \* AK\_GetNth\_L2 (int pos, struct list\_node \*row)

Function that fetches the nth element in a row.

char \* AK\_get\_array\_perms (char \*arr)

Get all permutations without repetition (currently not used, but it can be helpful)

AK\_vertex AK\_search\_vertex (int id)

Function that searches for a specific graph node by its ID.

AK vertex AK search empty link ()

Looks for empty link for a new graph node.

AK\_vertex AK\_add\_vertex (int id)

Function that adds a new graph node.

· AK succesor AK add succesor (int succesorId, int succesorOf)

Creates an edge between two nodes.

AK\_stack AK\_search\_empty\_stack\_link (AK\_stack stackRoot)

Returns a empty link for the stack.

AK stack AK push to stack (int id)

Adds a entry to the stack.

AK\_stack AK\_pop\_from\_stack ()

Pops a entry to the stack.

AK stack AK search in stack (int id)

Finds an element in the stack.

- int MIN (int X, int Y)
- void AK\_tarjan (int id)

Tarjan algorithm that looks for a strongly connected component inside all subgraphs; using DFS.

• TestResult AK tarjan test ()

Function for testing Tarjan's algorithm.

AK\_synchronization\_info \* AK\_init\_critical\_section ()

Initializes an AK\_synchronization\_info structure and returns an owned pointer that must later be passed on to AK\_\cup destroy\_critical\_section.

void AK\_destroy\_critical\_section (AK\_synchronization\_info \*info)

Destroys a synchronization object when it is no longer necessary and frees the pointer.

void AK\_enter\_critical\_section (AK\_synchronization\_info \*info)

Enters a critical section.

void AK\_leave\_critical\_section (AK\_synchronization\_info \*info)

Leaves a critical section.

#### **Variables**

· int testMode

You can turn testMode on or off with TEST\_MODE\_ON and TEST\_MODE\_OFF. To do this, simply enable or disable it in YOUR function (not in any other!) Test mode can be used when you need some special cases in your functions (i.e., when you are testing some functionality, which doesn't apply in normal conditions). But don't forget to turn this mode off, after you are done (within test function for example)!

### 7.2.1 Detailed Description

Header file that provides a data structure for the auxiliary functions

86 File Documentation

### 7.2.2 Macro Definition Documentation

### 7.2.2.1 MAX\_LOOP\_ITERATIONS

#define MAX\_LOOP\_ITERATIONS 1000

### 7.2.2.2 TBL\_BOX\_OFFSET

#define TBL\_BOX\_OFFSET 1

# 7.2.3 Typedef Documentation

### 7.2.3.1 AK\_graph

 ${\tt typedef \ struct \ Vertex \ AK\_graph}$ 

### 7.2.3.2 AK\_list

typedef struct list\_node AK\_list

### 7.2.3.3 AK\_list\_elem

typedef struct list\_node\* AK\_list\_elem

### 7.2.3.4 AK\_stack

typedef struct Stack\* AK\_stack

### 7.2.3.5 AK\_stackHead

```
typedef struct Stack AK_stackHead
```

### 7.2.3.6 AK\_succesor

```
typedef struct Succesor* AK_succesor
```

### 7.2.3.7 AK\_vertex

```
typedef struct Vertex* AK_vertex
```

### 7.2.4 Function Documentation

### 7.2.4.1 AK\_add\_succesor()

Creates an edge between two nodes.

**Author** 

Frane Jakelić

#### **Parameters**

succesorId	id of a newly created edge
succesorOf	source of the newly created edge

### Returns

pointer to the newly created edge

### 7.2.4.2 AK\_add\_vertex()

88 File Documentation

Function that adds a new graph node.

**Author** 

Frane Jakelić

### **Parameters**

id	of the vertex that needs to be added
graphRoot	root node of the graph structure

#### Returns

pointer to the newly created node

### 7.2.4.3 AK\_chars\_num\_from\_number()

Function that gets the number of digits for any given number.

Author

Dino Laktašić.

### **Parameters**

number	number to evaluate
int	base mathematic base (e.g. 2, 10 etc.)

#### Returns

the number of digits for the given number

### 7.2.4.4 AK\_convert\_type()

Function that change type of argument from string to integer.

Author

Aleksandra Polak

#### **Parameters**

*arg_type	type of an argument
-----------	---------------------

#### Returns

EXIT\_SUCCESS of the function (return type of argument in value of integer) or EXIT\_ERROR

Function that change type of argument from string to integer.

**Author** 

Aleksandra Polak

#### **Parameters**

*arg_type	type of argument
-----------	------------------

#### Returns

EXIT\_SUCCESS of the function (return type of argument as a value of the integer) or EXIT\_ERROR

# 7.2.4.5 AK\_define\_tarjan\_graph()

```
void AK_define_tarjan_graph ( )
```

Function for creating graph for testing tarjan algorithm.

Author

Blaž Rajič

#### **Parameters**

```
graph AK_graph where graph will be created
```

**Author** 

Blaž Rajič

### 7.2.4.6 AK\_Delete\_L3()

90 File Documentation

Function that deletes the current element of the list.

#### Author

Ljiljana Pintarić.

#### **Parameters**

current	current element of the list	
L	root of the list @retrun No return value	

### 7.2.4.7 AK\_DeleteAll\_L3()

```
void AK_DeleteAll_L3 ( struct \ list\_node \ ** \ L \ )
```

Function that empties the list.

#### Author

Ljiljana Pintarić.

#### **Parameters**

```
L root of the list
```

### Returns

No return value

### 7.2.4.8 AK\_destroy\_critical\_section()

```
void AK_destroy_critical_section ( {\tt AK\_synchronization\_info} \ * \ info \ )
```

Destroys a synchronization object when it is no longer necessary and frees the pointer.

### Author

Marko Sinko

### **Parameters**

info Synchronization info structure
-------------------------------------

Returns

void

## 7.2.4.9 AK\_End\_L2()

Function that fetches the last element of the list.

Author

Ljiljana Pintarić.

#### **Parameters**

L root of the list

#### Returns

last element of the list

## 7.2.4.10 AK\_enter\_critical\_section()

Enters a critical section.

Author

Marko Sinko

#### **Parameters**

info | Synchronization info structure

Returns

void

## 7.2.4.11 AK\_First\_L2()

Function that fetches the first element of the list.

**Author** 

Ljiljana Pintarić.

#### **Parameters**

L root of the list

#### Returns

first element of the list

## 7.2.4.12 AK\_get\_array\_perms()

Get all permutations without repetition (currently not used, but it can be helpful)

**Author** 

Dino Laktašić.

### **Parameters**

arr array of chars to perform permutation on

#### Returns

char pointer to an array of pointers pointing to permuted char arrays

Get all permutations without repetition (currently not used, but it can be helpful)

Author

Matija Novak

#### **Parameters**

SearchElement	element whose posititon we search for
L	root of the list

#### Returns

returns the posititon number of some elelemnt

#### **Author**

Dino Laktašić.

Get all permutations without repetition (currently not used, but it can be helpful)

#### **Parameters**

array of chars to perform permutation on	
--	--

#### Returns

char pointer to an array of pointers pointing to permuted char arrays

## 7.2.4.13 AK\_GetNth\_L2()

Function that fetches the nth element in a row.

#### Author

Ljiljana Pintarić

#### **Parameters**

pos	position of element in a row
row	list of elements of a row in the table

### Returns

element of list of elements of a row in the table

Function that fetches the nth element in a row.

#### **Author**

Matija Šestak.

#### **Parameters**

current	current list element
L	root of the list

#### Returns

data type of the current list element

## Author

Matija Šestak.

Function that fetches the data size of the element

#### **Parameters**

current	current list element
L	- root of the list

## Returns

data size of the current list element

#### Author

Ljiljana Pintarić

Function that fetches the nth element in a row

#### **Parameters**

pos	position of element in a row
row	list of elements of a row in the table

## Returns

element of list of elements of a row in the table

## 7.2.4.14 AK\_init\_critical\_section()

```
AK_synchronization_info* AK_init_critical_section ( )
```

Initializes an AK\_synchronization\_info structure and returns an owned pointer that must later be passed on to  $A \leftarrow K_destroy\_critical\_section$ .

Author

Marko Sinko

Returns

Initialized synchronization object

## 7.2.4.15 AK\_Init\_L3()

Function that initializes an empty list.

**Author** 

Ljiljana Pintarić

#### **Parameters**

```
L root of the list
```

Returns

NO return value

## 7.2.4.16 AK\_InsertAfter\_L2()

Function that inserts a new element after the current element of the list.

Author

Ljiljana Pintarić.

#### **Parameters**

data	new data
current	current element of the list
1	root of the list

Generated by Doxygen

#### Returns

No return value.

## 7.2.4.17 AK\_InsertAtBegin\_L3()

Function that inserts a new element at the beginning of the list. It uses function called: AK\_InsertBefore\_L.

#### **Author**

Ljiljana Pintarić.

## **Parameters**

data	new data
L	root of the list

#### Returns

No return value

## 7.2.4.18 AK\_InsertAtEnd\_L3()

Function that inserts a new element at the end of the list. It uses a function called: AK\_InsertAfter\_L2.

## Author

Ljiljana Pintarić.

#### **Parameters**

data	new data
L	root of the list

#### Returns

No return value.

## 7.2.4.19 AK\_InsertBefore\_L2()

Function that inserts a new element before the current element of the list.

## Author

Ljiljana Pintarić.

#### **Parameters**

data	new data
current	current element of the list
L	root of the list

#### Returns

No return value

## 7.2.4.20 AK\_IsEmpty\_L2()

```
unsigned int AK_IsEmpty_L2 ( {\tt struct\ list\_node\ *\ L\ )}
```

Function that tests if the list is empty.

#### Author

Ljiljana Pintarić.

### **Parameters**

L root of the list

#### Returns

1 if the list is empty, otherwise returns 0

## 7.2.4.21 AK\_leave\_critical\_section()

Leaves a critical section.

Author

Marko Sinko

#### **Parameters**

info Synchronization info structure

## Returns

void

### 7.2.4.22 AK\_Next\_L2()

Function that fetches the next element of the list.

Author

Ljiljana Pintarić.

**Parameters** 

current | current element of the list

#### Returns

next element of the list

## 7.2.4.23 AK\_pop\_from\_stack()

```
AK_stack AK_pop_from_stack ( )
```

Pops a entry to the stack.

**Author** 

Frane Jakelić

Returns

pointer to the popped stack node

## 7.2.4.24 AK\_Previous\_L2()

Function that fetches the previous element of the list.

Author

Ljiljana Pintarić.

#### **Parameters**

	current	current element of the list
ĺ	L	root of the list

Returns

previous element of the list

#### 7.2.4.25 AK\_push\_to\_stack()

Adds a entry to the stack.

Author

Frane Jakelić

#### **Parameters**

id of the element that is being added to the stack

#### Returns

pointer to the newly added stack node

## 7.2.4.26 AK\_Retrieve\_L2()

Function that retrieves the data from the current element of the list.

## Author

Ljiljana Pintarić.

#### **Parameters**

current	current element of the list
L	root of the list

## Returns

data from the list element

## 7.2.4.27 AK\_search\_empty\_link()

```
AK_vertex AK_search_empty_link ( )
```

Looks for empty link for a new graph node.

#### **Author**

Frane Jakelić

#### **Parameters**

graphRoot	oot node of the graph structure
-----------	---------------------------------

#### Returns

empty link for a new graph node

## 7.2.4.28 AK\_search\_empty\_stack\_link()

Returns a empty link for the stack.

**Author** 

Frane Jakelić

#### **Parameters**

#### Returns

pointer to the empty link

## 7.2.4.29 AK\_search\_in\_stack()

Finds an element in the stack.

Author

Frane Jakelić

#### **Parameters**

id of the node that needs to be found in the stack

#### Returns

pointer to the found stack node

## 7.2.4.30 AK\_search\_vertex()

```
\begin{tabular}{lll} AK\_vertex & AK\_search\_vertex & ( \\ & int & id & ) \end{tabular}
```

Function that searches for a specific graph node by its ID.

**Author** 

Frane Jakelić

#### **Parameters**

id	of the vertex that needs to be found
graphRoot	root node of the graph structure

#### Returns

found graph nod or null

## 7.2.4.31 AK\_Size\_L2()

```
int AK_Size_L2 ( struct\ list\_node\ *\ L\ )
```

Function that fetches the number of the elements in the list.

Author

Ljiljana Pintarić.

### **Parameters**

```
L root of the list
```

#### Returns

Size of the list

## 7.2.4.32 AK\_strcmp()

```
int AK_strcmp (  {\rm const\ void\ *\ a,}   {\rm const\ void\ *\ b\ )}
```

Function compares two Strings.

#### Author

Dino Laktašić

#### **Parameters**

	pointer of a value to compare
*b	pointer of a value to compare

#### Returns

result of the comparison in line with strcmp function

## 7.2.4.33 AK\_tarjan()

```
void AK_tarjan (
          int id )
```

Tarjan algorithm that looks for a strongly connected component inside all subgraphs; using DFS.

#### Author

Frane Jakelić

#### **Parameters**

id of the element on which the algorithm looks for an id of a strongly connected component

## Author

Frane Jakelić, updated by Blaž Rajič

#### **Parameters**

id of the element on which the algorithm looks for an id of a strongly connected component

## 7.2.4.34 AK\_tarjan\_test()

```
TestResult AK_tarjan_test ( )
```

Function for testing Tarjan's algorithm.

Author

Blaž Rajič

#### Returns

No return value

## 7.2.4.35 AK\_type\_size()

Function returns the size in bytes for the provided database type.

#### **Author**

Miroslav Policki

## **Parameters**

iDB_type	database data type (defined in constants.h)	
szVarchar	if iDB_type == TYPE_VARCHAR, pointer to the string, otherwise unused	

## Returns

size of provided data type in bytes if the provided data type is valid, else return 0

# 7.2.4.36 MIN()

# 7.2.5 Variable Documentation

#### 7.2.5.1 testMode

testMode

You can turn testMode on or off with TEST\_MODE\_ON and TEST\_MODE\_OFF. To do this, simply enable or disable it in YOUR function (not in any other!) Test mode can be used when you need some special cases in your functions (i.e., when you are testing some functionality, which doesn't apply in normal conditions). But don't forget to turn this mode off, after you are done (within test function for example)!

Domagoj Šitum

# 7.3 auxi/configuration.h File Reference

#include "iniparser.h"

Include dependency graph for configuration.h: This graph shows which files directly or indirectly include this file:

#### **Macros**

• #define AK BLOBS PATH (iniparser getstring(AK config, "general:blobs folder", "./blobs"))

Constant declaring the path of blobs folder (note: if changed keep in mind for make clean in makefile). Path declared in config.ini has to be absolute (tied up with installation package), but for debugging purpose we are going to keep it relative.

- #define DB FILE (iniparser getstring(AK config, "general:db file", "kalashnikov.db"))
- #define MAX\_NUM\_OF\_BLOCKS (iniparser\_getint(AK\_config, "segments:max\_num\_of\_blocks",200))

Constant declaring the maximum number of blocks in a segment.

#define MAX\_EXTENTS\_IN\_SEGMENT 200

Constant declaring the maximum number of extents in segment.

- #define MAX\_FREE\_SPACE\_SIZE (iniparser\_getint(AK\_config,"blocks:max\_AK\_free\_space\_size",4000))
   Constant declaring the maximum free space in block.
- #define MAX\_LAST\_TUPLE\_DICT\_SIZE\_TO\_USE (iniparser\_getint(AK\_config,"dictionary:max\_last\_
   tuple\_dict\_size\_to\_use",470))

Constant declaring the maximum size od last tuple in a dictionary.

#define DB\_FILE\_SIZE (iniparser\_getint(AK\_config, "general:db\_file\_size",40))

Constant declaring size of DB file in MB.

- #define DB FILE BLOCKS NUM (1024 \* 1024 \* DB FILE SIZE / sizeof(AK block))
- #define INITIAL\_EXTENT\_SIZE (iniparser\_getint(AK\_config,"extents:initial\_extent\_size",15))

Constant declaring initial extent size in blocks.

- #define EXTENT\_GROWTH\_TABLE (iniparser\_getdouble(AK\_config,"extents:extent\_growth\_table",0.5))

  Constant declaring extent growth factor for tables.
- #define EXTENT\_GROWTH\_INDEX (iniparser\_getdouble(AK\_config,"extents:extent\_growth\_index",0.2))

  Constant declaring extent growth factor for indices.

Constant declaring extent growth factor for transaction segments.

- #define EXTENT\_GROWTH\_TEMP (iniparser\_getdouble(AK\_config,"extents:extent\_growth\_temp",0.5))
   Constant declaring extent growth factor for temporary segments.
- #define ARCHIVELOG\_PATH (iniparser\_getstring(AK\_config, "redolog:archivelog\_folder", "./archivelog"))

Constant declaring the path of archivelog folder.

• #define MAX REDO LOG MEMORY 4096

The maximum size of REDO log memory.

• #define MAX\_REDO\_LOG\_ENTRIES 100

The maximum size of REDO log entries.

#define NUMBER\_OF\_THREADS (iniparser\_getint(AK\_config, "general:number\_of\_threads",42))

Constant declaring maximum number of threads that an application can acquire.

#### 7.3.1 Macro Definition Documentation

#### 7.3.1.1 AK\_BLOBS\_PATH

```
#define AK_BLOBS_PATH (iniparser_getstring(AK_config, "general:blobs_folder", "./blobs"))
```

Constant declaring the path of blobs folder (note: if changed keep in mind for make clean in makefile). Path declared in config.ini has to be absolute (tied up with installation package), but for debugging purpose we are going to keep it relative.

#### 7.3.1.2 ARCHIVELOG\_PATH

```
#define ARCHIVELOG_PATH (iniparser_getstring(AK_config, "redolog:archivelog_folder", "./archivelog"))
```

Constant declaring the path of archivelog folder.

#### 7.3.1.3 DB\_FILE

```
#define DB_FILE (iniparser_getstring(AK_config, "general:db_file", "kalashnikov.db"))
```

#### 7.3.1.4 DB FILE BLOCKS NUM

```
\texttt{\#define DB\_FILE\_BLOCKS\_NUM (1024 * 1024 * DB\_FILE\_SIZE / sizeof(AK\_block))}
```

#### 7.3.1.5 DB\_FILE\_SIZE

```
#define DB_FILE_SIZE (iniparser_getint(AK_config, "general:db_file_size",40))
```

Constant declaring size of DB file in MB.

### 7.3.1.6 EXTENT\_GROWTH\_INDEX

```
#define EXTENT_GROWTH_INDEX (iniparser_getdouble(AK_config,"extents:extent_growth_index",0.2))
```

Constant declaring extent growth factor for indices.

#### 7.3.1.7 EXTENT\_GROWTH\_TABLE

```
#define EXTENT_GROWTH_TABLE (iniparser_getdouble(AK_config,"extents:extent_growth_table",0.5))
```

Constant declaring extent growth factor for tables.

#### 7.3.1.8 EXTENT\_GROWTH\_TEMP

```
#define EXTENT_GROWTH_TEMP (iniparser_getdouble(AK_config, "extents:extent_growth_temp",0.5))
```

Constant declaring extent growth factor for temporary segments.

### 7.3.1.9 EXTENT\_GROWTH\_TRANSACTION

Constant declaring extent growth factor for transaction segments.

#### 7.3.1.10 INITIAL EXTENT SIZE

```
#define INITIAL_EXTENT_SIZE (iniparser_getint(AK_config,"extents:initial_extent_size",15))
```

Constant declaring initial extent size in blocks.

## 7.3.1.11 MAX\_EXTENTS\_IN\_SEGMENT

```
#define MAX_EXTENTS_IN_SEGMENT 200
```

Constant declaring the maximum number of extents in segment.

#### 7.3.1.12 MAX\_FREE\_SPACE\_SIZE

```
#define MAX_FREE_SPACE_SIZE (iniparser_getint(AK_config, "blocks:max_AK_free_space_size",4000))
```

Constant declaring the maximum free space in block.

## 7.3.1.13 MAX\_LAST\_TUPLE\_DICT\_SIZE\_TO\_USE

Constant declaring the maximum size od last tuple in a dictionary.

#### 7.3.1.14 MAX\_NUM\_OF\_BLOCKS

```
#define MAX_NUM_OF_BLOCKS (iniparser_getint(AK_config, "segments:max_num_of_blocks",200))
```

Constant declaring the maximum number of blocks in a segment.

#### 7.3.1.15 MAX\_REDO\_LOG\_ENTRIES

```
#define MAX_REDO_LOG_ENTRIES 100
```

The maximum size of REDO log entries.

## 7.3.1.16 MAX\_REDO\_LOG\_MEMORY

```
#define MAX_REDO_LOG_MEMORY 4096
```

The maximum size of REDO log memory.

## 7.3.1.17 NUMBER\_OF\_THREADS

```
#define NUMBER_OF_THREADS (iniparser_getint(AK_config, "general:number_of_threads", 42))
```

Constant declaring maximum number of threads that an application can acquire.

## 7.4 auxi/constants.h File Reference

This graph shows which files directly or indirectly include this file:

#### **Macros**

#define MAX\_VARCHAR\_LENGTH 200

Constant declaring the maximum length of varchar data value.

#define MAX ATTRIBUTES 10

Constant declaring the maximum number of attributes per block.

#define MAX\_ATT\_NAME 255

Constant declaring the maximum length of attribute name string (used in AK\_header->att\_name)

#define MAX CONSTRAINTS 5

Constant declaring the maximum number of constraints per attribute.

#define MAX\_CONSTR\_NAME 255

Constant declaring the maximum length of constraint name string (used in AK header->constr name)

#define MAX CONSTR CODE 255

Constant declaring the maximum lenght of constraint code string.

#define MAX\_OBSERVABLE\_OBSERVERS 4096

Constant for declaring the maximum number of observers objects for some observable type.

#define MAX ACTIVE TRANSACTIONS COUNT 100

Constant for declaring the maximum number of active trasactions in DBMS.

• #define DATA BLOCK SIZE 500

Constant declaring length of data block size (used in AK\_block->data)

• #define DATA ENTRY SIZE 10

Constant declaring lenght of data entry in sizeof( int )

#define MAX QUERY LIB MEMORY 255

Constant declaring the maximum size of query lib memory.

#define MAX\_CACHE\_MEMORY 255

Constant declaring the maximum size of DB cache memory.

#define MAX\_QUERY\_DICT\_MEMORY 255

Constant declaring the maximum size of query dictionary memory.

• #define MAX\_QUERY\_RESULT\_MEMORY 255

Constant declaring the maximum size of query result cache memory.

• #define MAX\_TOKENS 255

Constant declaring the maximum number of attributes to handle in relation equivalence function.

#define MAX\_MAIN\_BUCKETS 512

Constant declaring the maximum number of main buckets.

#define MAIN\_BUCKET\_SIZE 4

Constant declaring the size of main buckets.

#define HASH BUCKET SIZE 4

Constant declaring the size of hash buckets.

• #define NUMBER OF KEYS 4096

Constant declaring the number of buckets in hash table.

#define EXIT\_SUCCESS 0

Constant declaring a successful exit.

#define EXIT\_ERROR -1

Constant declaring unsuccessful exit.

- #define EXIT\_WARNING -2
- #define BLOCK\_TYPE\_FREE -1

Constant declaring AK\_free block type (used in AK\_block->type)

#define BLOCK TYPE NORMAL 0

Constant declaring normal block type e.g. used by some extent (used in AK\_block->type)

• #define BLOCK TYPE CHAINED 1

Constant declaring chained block type e.g. used if the block is chained with another (used in AK\_block->type)

#define NOT\_CHAINED -1

Constant used in AK\_block->chained\_with if the block isn't chained. • #define FREE INT -10 Constant declaring dummy data for empty integers. • #define FREE CHAR '\0' Constant declaring dummy data for empty chars. • #define SEGMENT TYPE SYSTEM TABLE 0 Constant declaring system table segment type (used in system catalog) #define SEGMENT TYPE TABLE 1 Constant declaring table segment type (used in system catalog) #define SEGMENT TYPE INDEX 2 Constant declaring index segment type (used in system catalog) #define SEGMENT\_TYPE\_TRANSACTION 3 Constant declaring transaction segment type (used in system catalog) #define SEGMENT TYPE TEMP 4 Constant declaring temporary segment type (used in system catalog) • #define TYPE\_INTERNAL 0 Constant declaring internal data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE INT 1 integer data type (used in AK\_header->type and AK\_tuple\_dict->type) • #define TYPE FLOAT 2 Constant declaring float data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE NUMBER 3 Constant declaring number data type (used in AK\_header->type and AK\_tuple\_dict->type) • #define TYPE VARCHAR 4 Constant declaring varchar data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE DATE 5 Constant declaring date data type (used in AK\_header->type and AK\_tuple\_dict->type) • #define TYPE\_DATETIME 6 Datetime data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE TIME 7 Constant declaring time data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE INTERVAL 8 Blob data type (used in AK\_header->type and AK\_tuple\_dict->type) • #define TYPE PERIOD 9 Blob data type (used in AK\_header->type and AK\_tuple\_dict->type) • #define TYPE BLOB 10 Blob data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE BOOL 11 Constant declaring boolean data type (used in AK\_header->type and AK\_tuple\_dict->type) #define TYPE OPERAND 12 Constant indicating operand in AK\_list. #define TYPE OPERATOR 13 indicates operator in AK\_list • #define TYPE ATTRIBS 14 Constant indicating attribute/s in AK\_list. #define TYPE CONDITION 15 Constant indicating condition in AK\_list. #define BLOCK CLEAN 0 Constant indicating block cleaning (not changed since read from disk) #define BLOCK DIRTY 1

Constant indicating dirty block (changed since read from disk, has to be written)

#define ATTR\_DELIMITER ";"

Constant declaring attributes delimiter.

• #define ATTR ESCAPE "'

Constant indicating attributes escape section.

• #define NULLL "asdfgXYZ"

Constant declaring null value for tables.

- #define RO SELECTION 's'
- #define RO\_PROJECTION 'p'
- #define RO\_NAT\_JOIN 'n'
- #define RO RENAME 'r'
- #define RO UNION 'u'
- #define RO INTERSECT 'i'
- #define RO\_EXCEPT 'e'
- #define RO\_THETA\_JOIN 't'
- #define NEW VALUE 0

Constant indicating that the data is a new value.

#define SEARCH CONSTRAINT 1

Constant indicating that the data is constraint to search for.

#define UPDATE 0

Constant indicating that the operation to be performed is 'update'.

• #define DELETE 1

Constant indicating that the operation to be performed is 'delete'.

• #define INSERT 2

Constant indicating that the operation to be performed is 'insert'.

• #define SELECT 3

Constant indicating 'select' operation.

• #define FIND 2

Constant indicating that the operation to be performed is 'search'.

• #define INFO\_BUCKET 0

Constant declaring the type of bucket as "info bucket" when inserting bucket to block.

• #define MAIN BUCKET 1

Constant declaring the type of bucket as "main bucket" when inserting bucket to block.

#define HASH\_BUCKET 2

Constant declaring the type of bucket as "hash bucket" when inserting bucket to block.

#define SHARED LOCK 0

Constant declaring the type of lock as SHARED LOCK.

• #define EXCLUSIVE\_LOCK 1

Constant declaring the type of lock as EXCLUSIVE LOCK.

#define WAIT FOR UNLOCK 0

Constant declaring that a lock has to wait until other locks release the resource.

#define PASS\_LOCK\_QUEUE 1

Constant declaring that a lock can acquire the resource AK\_freely.

#define OK 1

Constant declaring that the method is completed successfuly.

• #define NOT OK 0

Constant declaring that the method isn't completed successfuly.

#define COMMIT 1

Constant declaring that the transaction is completed successfuly.

• #define ABORT 0

Constant declaring if the transaction is being aborted.

• #define NEW\_ID 0

Constant declaring if new obj\_id should be created.

• #define MAX BLOCKS CURRENTLY ACCESSED 32

Indicates the maximum number of threads that can access (read or write) database at the same time.

• #define TEST\_MODE\_ON 1

This constant is used to turn testMode (auxi/auxillary.h) ON.

#define TEST MODE OFF 0

This constant is used to turn testMode (auxi/auxillary.h) OFF.

#define SEPARATOR "[{(|&&|)}]"

Used in unique.c for separation of names of attributes and their values when UNIQUE constraint is being set or tested on combination of values of attributes.

#define AK\_CONSTRAINTS\_BEWTEEN "AK\_constraints\_between"

Defines system table name for storing between constraints.

#define AK CONSTRAINTS CHECK CONSTRAINT "AK constraints check constraint"

Defines system table name for storing check constraints.

• #define AK CONSTRAINTS NOT NULL "AK constraints not null"

Defines system table name for storing check constraints.

#define AK CONSTRAINTS UNIQUE "AK constraints unique"

Defines system table name for storing check constraints.

#define AK CONSTRAINTS INDEX "AK constraints index"

Defines system table name for storing check constraints.

#define AK\_CONSTRAINTS\_PRIMARY\_KEY "AK\_constraints\_primary\_key"

Defines system table name for storing check constraints.

#define AK\_CONSTRAINTS\_FOREIGN\_KEY "AK\_constraints\_foreign\_key"

Defines system table name for storing check constraints.

• #define AK CONSTRAINTS DEFAULT "AK constraints default"

Defines system table name for storing check constraints.

• #define AK\_REFERENCE "AK\_reference"

Defines system table name for storing check constraints.

• #define DROP\_TABLE 0

Constant which defines the number of drop statement.

#define DROP\_INDEX 1

Constant which defines the number of drop statement.

• #define DROP\_VIEW 2

Constant which defines the number of drop statement.

• #define DROP\_SEQUENCE 3

Constant which defines the number of drop statement.

#define DROP\_TRIGGER 4

Constant which defines the number of drop statement.

#define DROP\_FUNCTION 5

Constant which defines the number of drop statement.

• #define DROP\_USER 6

Constant which defines the number of drop statement.

• #define DROP\_GROUP 7

Constant which defines the number of drop statement.

#define DROP CONSTRAINT 8

Constant which defines thenumber of drop statement.

• #define NUM\_SYS\_TABLES 20

Constant which defines the length of system\_catalog.

# 7.4.1 Detailed Description

Header file that provides global macros, constants and variables

#### 7.4.2 Macro Definition Documentation

## 7.4.2.1 ABORT

#define ABORT 0

Constant declaring if the transaction is being aborted.

#### 7.4.2.2 AK\_CONSTRAINTS\_BEWTEEN

#define AK\_CONSTRAINTS\_BEWTEEN "AK\_constraints\_between"

Defines system table name for storing between constraints.

### 7.4.2.3 AK\_CONSTRAINTS\_CHECK\_CONSTRAINT

 $\verb|#define AK_CONSTRAINTS_CHECK_CONSTRAINT "AK_constraints\_check_constraint"|\\$ 

Defines system table name for storing check constraints.

### 7.4.2.4 AK\_CONSTRAINTS\_DEFAULT

#define AK\_CONSTRAINTS\_DEFAULT "AK\_constraints\_default"

Defines system table name for storing check constraints.

• –

## 7.4.2.5 AK\_CONSTRAINTS\_FOREIGN\_KEY

#define AK\_CONSTRAINTS\_FOREIGN\_KEY "AK\_constraints\_foreign\_key"

Defines system table name for storing check constraints.

• –

### 7.4.2.6 AK\_CONSTRAINTS\_INDEX

```
#define AK_CONSTRAINTS_INDEX "AK_constraints_index"
```

Defines system table name for storing check constraints.

• –

## 7.4.2.7 AK\_CONSTRAINTS\_NOT\_NULL

#define AK\_CONSTRAINTS\_NOT\_NULL "AK\_constraints\_not\_null"

Defines system table name for storing check constraints.

### 7.4.2.8 AK\_CONSTRAINTS\_PRIMARY\_KEY

#define AK\_CONSTRAINTS\_PRIMARY\_KEY "AK\_constraints\_primary\_key"

Defines system table name for storing check constraints.

• –

## 7.4.2.9 AK\_CONSTRAINTS\_UNIQUE

#define AK\_CONSTRAINTS\_UNIQUE "AK\_constraints\_unique"

Defines system table name for storing check constraints.

## 7.4.2.10 AK\_REFERENCE

```
#define AK_REFERENCE "AK_reference"
```

Defines system table name for storing check constraints.

#### 7.4.2.11 ATTR\_DELIMITER

```
#define ATTR_DELIMITER ";"
```

Constant declaring attributes delimiter.

## 7.4.2.12 ATTR\_ESCAPE

```
#define ATTR_ESCAPE '`'
```

Constant indicating attributes escape section.

# 7.4.2.13 BLOCK\_CLEAN

```
#define BLOCK_CLEAN 0
```

Constant indicating block cleaning (not changed since read from disk)

## 7.4.2.14 BLOCK\_DIRTY

```
#define BLOCK_DIRTY 1
```

Constant indicating dirty block (changed since read from disk, has to be written)

## 7.4.2.15 BLOCK\_TYPE\_CHAINED

```
#define BLOCK_TYPE_CHAINED 1
```

Constant declaring chained block type e.g. used if the block is chained with another (used in AK\_block->type)

# 7.4.2.16 BLOCK\_TYPE\_FREE

```
#define BLOCK_TYPE_FREE -1
```

Constant declaring AK\_free block type (used in AK\_block->type)

#### 7.4.2.17 BLOCK\_TYPE\_NORMAL

```
#define BLOCK_TYPE_NORMAL 0
```

Constant declaring normal block type e.g. used by some extent (used in AK\_block->type)

#### 7.4.2.18 COMMIT

```
#define COMMIT 1
```

Constant declaring that the transaction is completed successfuly.

## 7.4.2.19 DATA\_BLOCK\_SIZE

```
#define DATA_BLOCK_SIZE 500
```

Constant declaring length of data block size (used in AK\_block->data)

## 7.4.2.20 DATA\_ENTRY\_SIZE

```
#define DATA_ENTRY_SIZE 10
```

Constant declaring lenght of data entry in sizeof( int )

#### 7.4.2.21 DELETE

```
#define DELETE 1
```

Constant indicating that the operation to be performed is 'delete'.

## 7.4.2.22 DROP\_CONSTRAINT

```
#define DROP_CONSTRAINT 8
```

Constant which defines thenumber of drop statement.

## 7.4.2.23 DROP\_FUNCTION

```
#define DROP_FUNCTION 5
```

Constant which defines the number of drop statement.

## 7.4.2.24 DROP\_GROUP

```
#define DROP_GROUP 7
```

Constant which defines the number of drop statement.

# 7.4.2.25 DROP\_INDEX

```
#define DROP_INDEX 1
```

Constant which defines the number of drop statement.

## 7.4.2.26 DROP\_SEQUENCE

```
#define DROP_SEQUENCE 3
```

Constant which defines the number of drop statement.

## 7.4.2.27 **DROP\_TABLE**

```
#define DROP_TABLE 0
```

Constant which defines the number of drop statement.

## 7.4.2.28 DROP\_TRIGGER

```
#define DROP_TRIGGER 4
```

Constant which defines the number of drop statement.

## 7.4.2.29 DROP\_USER

```
#define DROP_USER 6
```

Constant which defines the number of drop statement.

## 7.4.2.30 DROP\_VIEW

```
#define DROP_VIEW 2
```

Constant which defines the number of drop statement.

## 7.4.2.31 EXCLUSIVE\_LOCK

```
#define EXCLUSIVE_LOCK 1
```

Constant declaring the type of lock as EXCLUSIVE LOCK.

## 7.4.2.32 EXIT\_ERROR

```
#define EXIT_ERROR -1
```

Constant declaring unsuccessful exit.

## 7.4.2.33 EXIT\_SUCCESS

```
#define EXIT_SUCCESS 0
```

Constant declaring a successful exit.

## 7.4.2.34 EXIT\_WARNING

#define EXIT\_WARNING -2

#### 7.4.2.35 FIND

#define FIND 2

Constant indicating that the operation to be performed is 'search'.

## 7.4.2.36 FREE\_CHAR

#define FREE\_CHAR '\0'

Constant declaring dummy data for empty chars.

## 7.4.2.37 FREE\_INT

#define FREE\_INT -10

Constant declaring dummy data for empty integers.

## 7.4.2.38 HASH\_BUCKET

#define HASH\_BUCKET 2

Constant declaring the type of bucket as "hash bucket" when inserting bucket to block.

## 7.4.2.39 HASH\_BUCKET\_SIZE

#define HASH\_BUCKET\_SIZE 4

Constant declaring the size of hash buckets.

### 7.4.2.40 INFO\_BUCKET

```
#define INFO_BUCKET 0
```

Constant declaring the type of bucket as "info bucket" when inserting bucket to block.

#### 7.4.2.41 INSERT

```
#define INSERT 2
```

Constant indicating that the operation to be performed is 'insert'.

#### 7.4.2.42 MAIN\_BUCKET

```
#define MAIN_BUCKET 1
```

Constant declaring the type of bucket as "main bucket" when inserting bucket to block.

# 7.4.2.43 MAIN\_BUCKET\_SIZE

```
#define MAIN_BUCKET_SIZE 4
```

Constant declaring the size of main buckets.

## 7.4.2.44 MAX\_ACTIVE\_TRANSACTIONS\_COUNT

```
#define MAX_ACTIVE_TRANSACTIONS_COUNT 100
```

Constant for declaring the maximum number of active trasactions in DBMS.

## 7.4.2.45 MAX\_ATT\_NAME

```
#define MAX_ATT_NAME 255
```

Constant declaring the maximum length of attribute name string (used in AK\_header->att\_name)

#### 7.4.2.46 MAX\_ATTRIBUTES

#define MAX\_ATTRIBUTES 10

Constant declaring the maximum number of attributes per block.

#### 7.4.2.47 MAX\_BLOCKS\_CURRENTLY\_ACCESSED

#define MAX\_BLOCKS\_CURRENTLY\_ACCESSED 32

Indicates the maximum number of threads that can access (read or write) database at the same time.

## 7.4.2.48 MAX\_CACHE\_MEMORY

#define MAX\_CACHE\_MEMORY 255

Constant declaring the maximum size of DB cache memory.

## 7.4.2.49 MAX\_CONSTR\_CODE

#define MAX\_CONSTR\_CODE 255

Constant declaring the maximum lenght of constraint code string.

## 7.4.2.50 MAX\_CONSTR\_NAME

#define MAX\_CONSTR\_NAME 255

Constant declaring the maximum length of constraint name string (used in AK\_header->constr\_name)

## 7.4.2.51 MAX\_CONSTRAINTS

#define MAX\_CONSTRAINTS 5

Constant declaring the maximum number of constraints per attribute.

#### 7.4.2.52 MAX\_MAIN\_BUCKETS

#define MAX\_MAIN\_BUCKETS 512

Constant declaring the maximum number of main buckets.

#### 7.4.2.53 MAX\_OBSERVABLE\_OBSERVERS

#define MAX\_OBSERVABLE\_OBSERVERS 4096

Constant for declaring the maximum number of observers objects for some observable type.

## 7.4.2.54 MAX\_QUERY\_DICT\_MEMORY

#define MAX\_QUERY\_DICT\_MEMORY 255

Constant declaring the maximum size of query dictionary memory.

## 7.4.2.55 MAX\_QUERY\_LIB\_MEMORY

#define MAX\_QUERY\_LIB\_MEMORY 255

Constant declaring the maximum size of query lib memory.

## 7.4.2.56 MAX\_QUERY\_RESULT\_MEMORY

#define MAX\_QUERY\_RESULT\_MEMORY 255

Constant declaring the maximum size of query result cache memory.

## 7.4.2.57 MAX\_TOKENS

#define MAX\_TOKENS 255

Constant declaring the maximum number of attributes to handle in relation equivalence function.

## 7.4.2.58 MAX\_VARCHAR\_LENGTH

```
#define MAX_VARCHAR_LENGTH 200
```

Constant declaring the maximum length of varchar data value.

#### 7.4.2.59 NEW\_ID

```
#define NEW_ID 0
```

Constant declaring if new obj\_id should be created.

## 7.4.2.60 **NEW\_VALUE**

```
#define NEW_VALUE 0
```

Constant indicating that the data is a new value.

# 7.4.2.61 NOT\_CHAINED

```
#define NOT_CHAINED -1
```

Constant used in AK\_block->chained\_with if the block isn't chained.

## 7.4.2.62 NOT\_OK

```
#define NOT_OK 0
```

Constant declaring that the method isn't completed successfuly.

### 7.4.2.63 NULLL

```
#define NULLL "asdfqXYZ"
```

Constant declaring null value for tables.

## 7.4.2.64 NUM\_SYS\_TABLES

```
#define NUM_SYS_TABLES 20
```

Constant which defines the length of system\_catalog.

## 7.4.2.65 NUMBER\_OF\_KEYS

```
#define NUMBER_OF_KEYS 4096
```

Constant declaring the number of buckets in hash table.

#### 7.4.2.66 OK

```
#define OK 1
```

Constant declaring that the method is completed successfuly.

## 7.4.2.67 PASS\_LOCK\_QUEUE

```
#define PASS_LOCK_QUEUE 1
```

Constant declaring that a lock can acquire the resource AK\_freely.

#### 7.4.2.68 RO EXCEPT

```
#define RO_EXCEPT 'e'
```

# 7.4.2.69 RO\_INTERSECT

```
#define RO_INTERSECT 'i'
```

## 7.4.2.70 RO\_NAT\_JOIN

```
#define RO_NAT_JOIN 'n'
```

## 7.4.2.71 RO\_PROJECTION

#define RO\_PROJECTION 'p'

## 7.4.2.72 RO\_RENAME

#define RO\_RENAME 'r'

#### 7.4.2.73 RO\_SELECTION

#define RO\_SELECTION 's'

## 7.4.2.74 RO\_THETA\_JOIN

#define RO\_THETA\_JOIN 't'

## 7.4.2.75 RO\_UNION

#define RO\_UNION 'u'

#### 7.4.2.76 SEARCH\_CONSTRAINT

#define SEARCH\_CONSTRAINT 1

Constant indicating that the data is constraint to search for.

# 7.4.2.77 SEGMENT\_TYPE\_INDEX

#define SEGMENT\_TYPE\_INDEX 2

Constant declaring index segment type (used in system catalog)

## 7.4.2.78 SEGMENT\_TYPE\_SYSTEM\_TABLE

```
#define SEGMENT_TYPE_SYSTEM_TABLE 0
```

Constant declaring system table segment type (used in system catalog)

### 7.4.2.79 SEGMENT\_TYPE\_TABLE

```
#define SEGMENT_TYPE_TABLE 1
```

Constant declaring table segment type (used in system catalog)

### 7.4.2.80 SEGMENT\_TYPE\_TEMP

```
#define SEGMENT_TYPE_TEMP 4
```

Constant declaring temporary segment type (used in system catalog)

## 7.4.2.81 SEGMENT\_TYPE\_TRANSACTION

```
#define SEGMENT_TYPE_TRANSACTION 3
```

Constant declaring transaction segment type (used in system catalog)

### 7.4.2.82 SELECT

```
#define SELECT 3
```

Constant indicating 'select' operation.

#### **7.4.2.83 SEPARATOR**

```
#define SEPARATOR "[{(|&&|)}]"
```

Used in unique.c for separation of names of attributes and their values when UNIQUE constraint is being set or tested on combination of values of attributes.

### 7.4.2.84 SHARED\_LOCK

```
#define SHARED_LOCK 0
```

Constant declaring the type of lock as SHARED LOCK.

### 7.4.2.85 TEST\_MODE\_OFF

```
#define TEST_MODE_OFF 0
```

This constant is used to turn testMode (auxi/auxillary.h) OFF.

## 7.4.2.86 TEST\_MODE\_ON

```
#define TEST_MODE_ON 1
```

This constant is used to turn testMode (auxi/auxillary.h) ON.

## 7.4.2.87 TYPE\_ATTRIBS

```
#define TYPE_ATTRIBS 14
```

Constant indicating attribute/s in AK\_list.

# 7.4.2.88 TYPE\_BLOB

```
#define TYPE_BLOB 10
```

Blob data type (used in AK\_header->type and AK\_tuple\_dict->type)

# 7.4.2.89 TYPE\_BOOL

```
#define TYPE_BOOL 11
```

Constant declaring boolean data type (used in AK\_header->type and AK\_tuple\_dict->type)

## 7.4.2.90 TYPE\_CONDITION

```
#define TYPE_CONDITION 15
```

Constant indicating condition in AK\_list.

### 7.4.2.91 TYPE\_DATE

```
#define TYPE_DATE 5
```

Constant declaring date data type (used in AK\_header->type and AK\_tuple\_dict->type)

## 7.4.2.92 TYPE\_DATETIME

```
#define TYPE_DATETIME 6
```

Datetime data type (used in AK\_header->type and AK\_tuple\_dict->type)

# 7.4.2.93 TYPE\_FLOAT

```
#define TYPE_FLOAT 2
```

Constant declaring float data type (used in AK\_header->type and AK\_tuple\_dict->type)

# 7.4.2.94 TYPE\_INT

```
#define TYPE_INT 1
```

integer data type (used in AK\_header->type and AK\_tuple\_dict->type)

# 7.4.2.95 TYPE\_INTERNAL

```
#define TYPE_INTERNAL 0
```

Constant declaring internal data type (used in AK\_header->type and AK\_tuple\_dict->type)

### 7.4.2.96 TYPE\_INTERVAL

```
#define TYPE_INTERVAL 8
```

Blob data type (used in AK\_header->type and AK\_tuple\_dict->type)

### 7.4.2.97 TYPE\_NUMBER

```
#define TYPE_NUMBER 3
```

Constant declaring number data type (used in AK\_header->type and AK\_tuple\_dict->type)

## 7.4.2.98 TYPE\_OPERAND

```
#define TYPE_OPERAND 12
```

Constant indicating operand in AK\_list.

## 7.4.2.99 TYPE\_OPERATOR

```
#define TYPE_OPERATOR 13
```

indicates operator in AK\_list

# 7.4.2.100 TYPE\_PERIOD

```
#define TYPE_PERIOD 9
```

Blob data type (used in AK\_header->type and AK\_tuple\_dict->type)

# 7.4.2.101 TYPE\_TIME

```
#define TYPE_TIME 7
```

Constant declaring time data type (used in AK\_header->type and AK\_tuple\_dict->type)

### 7.4.2.102 TYPE\_VARCHAR

```
#define TYPE_VARCHAR 4
```

Constant declaring varchar data type (used in AK\_header->type and AK\_tuple\_dict->type)

### 7.4.2.103 UPDATE

```
#define UPDATE 0
```

Constant indicating that the operation to be performed is 'update'.

### 7.4.2.104 WAIT\_FOR\_UNLOCK

```
#define WAIT_FOR_UNLOCK 0
```

Constant declaring that a lock has to wait until other locks release the resource.

# 7.5 auxi/debug.c File Reference

```
#include "debug.h"
Include dependency graph for debug.c:
```

#### **Functions**

• int AK\_dbg\_messg (DEBUG\_LEVEL level, DEBUG\_TYPE type, const char \*format,...)

Function that prints the debug message. Provides debug level, debug type and message with corresponding variables for the output.

# 7.5.1 Detailed Description

Provides a function for debuging

### 7.5.2 Function Documentation

### 7.5.2.1 AK\_dbg\_messg()

Function that prints the debug message. Provides debug level, debug type and message with corresponding variables for the output.

Author

Dino Laktašić

#### **Parameters**

level	level of debug information for a given DB module
type	the name of DB module for which to print debug information
format	format for the output message
	variable number of (different) type args used in printf

#### Returns

if debug message is printed return 1, else return 0

# 7.6 auxi/debug.h File Reference

```
#include "stdarg.h"
#include "stdio.h"
#include "stdlib.h"
#include "mempro.h"
```

Include dependency graph for debug.h: This graph shows which files directly or indirectly include this file:

#### **Macros**

• #define DEBUG ALL 0

Set constant to 1 for a complete project debug, else set constant to 0.

# **Typedefs**

- typedef enum debug\_level DEBUG\_LEVEL
- typedef enum debug\_type DEBUG\_TYPE

## **Enumerations**

```
    enum debug_level { LOW = 1, MIDDLE = 0, HIGH = 0 }
    enum debug_type {
        GLOBAL = 0, DB_MAN = 0, FILE_MAN = 1, MEMO_MAN = 0,
        INDICES = 0, TABLES = 0, REL_OP = 0, REL_EQ = 1,
        CONSTRAINTS = 0, FUNCTIONS = 0, SEQUENCES = 0, TRIGGERS = 0,
        REDO = 0 }
```

#### **Functions**

• int AK\_dbg\_messg (DEBUG\_LEVEL level, DEBUG\_TYPE type, const char \*format,...)

Function that prints the debug message. Provides debug level, debug type and message with corresponding variables for the output.

## 7.6.1 Detailed Description

Header file that defines global macros, constants and variables for debuging

## 7.6.2 Macro Definition Documentation

## 7.6.2.1 DEBUG\_ALL

#define DEBUG\_ALL 0

Set constant to 1 for a complete project debug, else set constant to 0.

**Author** 

Dino Laktašić

# 7.6.3 Typedef Documentation

# 7.6.3.1 DEBUG\_LEVEL

typedef enum debug\_level DEBUG\_LEVEL

# 7.6.3.2 DEBUG\_TYPE

typedef enum debug\_type DEBUG\_TYPE

# 7.6.4 Enumeration Type Documentation

## 7.6.4.1 debug\_level

enum debug\_level

## Enumerator

LOW	
MIDDLE	
HIGH	

## 7.6.4.2 debug\_type

enum debug\_type

#### Enumerator

GLOBAL	
DB_MAN

MEMO_MAN	
INDICES	
TABLES	
REL_OP	
REL_EQ	
CONSTRAINTS	
FUNCTIONS	
SEQUENCES	
TRIGGERS	
REDO	

## 7.6.5 Function Documentation

# 7.6.5.1 AK\_dbg\_messg()

Function that prints the debug message. Provides debug level, debug type and message with corresponding variables for the output.

## Author

Dino Laktašić

level	level of debug information for a given DB module
type	the name of DB module for which to print debug information
format	format for the output message
	variable number of (different) type args used in printf

#### Returns

if debug message is printed return 1, else return 0

# 7.7 auxi/dictionary.c File Reference

Implements a dictionary for string variables.

```
#include "dictionary.h"
#include "test.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <unistd.h>
Include dependency graph for dictionary.c:
```

#### **Macros**

- #define MAXVALSZ 1024
- #define DICTMINSZ 128
- #define DICT\_INVALID\_KEY ((char\*)-1)

#### **Functions**

• unsigned dictionary\_hash (const char \*key)

Compute the hash key for a string.

dictionary \* dictionary\_new (int size)

Create a new dictionary object.

void dictionary\_del (dictionary \*d)

Delete a dictionary object.

• char \* dictionary\_get (dictionary \*d, const char \*key, char \*def)

Get a value from a dictionary.

• int dictionary\_set (dictionary \*d, const char \*key, const char \*val)

Set a value in a dictionary.

void dictionary\_unset (dictionary \*d, const char \*key)

Delete a key in a dictionary.

void dictionary\_dump (dictionary \*d, FILE \*out)

Dump a dictionary to an opened file pointer.

TestResult AK\_dictionary\_test ()

Function for testing the implementation.

### 7.7.1 Detailed Description

Implements a dictionary for string variables.

#### **Author**

N. Devillard This module implements a simple dictionary object, i.e. a list of string/string associations. This object is useful to store e.g. informations retrieved from a configuration file (ini files).

## 7.7.2 Macro Definition Documentation

## 7.7.2.1 DICT\_INVALID\_KEY

```
#define DICT_INVALID_KEY ((char*)-1)
```

Invalid key token

### 7.7.2.2 DICTMINSZ

```
#define DICTMINSZ 128
```

Minimal allocated number of entries in a dictionary

#### 7.7.2.3 MAXVALSZ

```
#define MAXVALSZ 1024
```

Maximum value size for integers and doubles.

### 7.7.3 Function Documentation

# 7.7.3.1 AK\_dictionary\_test()

```
TestResult AK_dictionary_test ( )
```

Function for testing the implementation.

**Author** 

Marko Belusic

## 7.7.3.2 dictionary\_del()

```
void dictionary_del ( \label{eq:dictionary} \mbox{dictionary} \ * \ d \ )
```

Delete a dictionary object.

#### **Parameters**

```
d dictionary object to deallocate.
```

### Returns

void

Deallocate a dictionary object and all memory associated to it.

### 7.7.3.3 dictionary\_dump()

Dump a dictionary to an opened file pointer.

### **Parameters**

d	Dictionary to dump
f	Opened file pointer.

## Returns

void

Dumps a dictionary onto an opened file pointer. Key pairs are printed out as [Key]=[Value], one per line. It is Ok to provide stdout or stderr as output file pointers.

## 7.7.3.4 dictionary\_get()

Get a value from a dictionary.

## **Parameters**

d	dictionary object to search.
key	Key to look for in the dictionary.
def	Default value to return if key not found.

### Returns

1 pointer to internally allocated character string.

This function locates a key in a dictionary and returns a pointer to its value, or the passed 'def' pointer if no such key can be found in dictionary. The returned character pointer points to data internal to the dictionary object, you should not try to AK\_free it or modify it.

#### 7.7.3.5 dictionary\_hash()

Compute the hash key for a string.

#### **Parameters**

key Character string to use for key.

#### Returns

1 unsigned int on at least 32 bits.

This hash function has been taken from an Article in Dr Dobbs Journal. This is normally a collision-AK\_free function, distributing keys evenly. The key is stored anyway in the struct so that collision can be avoided by comparing the key itself in last resort.

#### 7.7.3.6 dictionary\_new()

Create a new dictionary object.

#### **Parameters**

```
size Optional initial size of the dictionary.
```

#### Returns

1 newly allocated dictionary objet.

This function allocates a new dictionary object of given size and returns it. If you do not know in advance (roughly) the number of entries in the dictionary, give size=0.

### 7.7.3.7 dictionary\_set()

Set a value in a dictionary.

#### **Parameters**

d	dictionary object to modify.
key	Key to modify or add.
val	Value to add.

#### Returns

int 0 if Ok, anything else otherwise

If the given key is found in the dictionary, the associated value is replaced by the provided one. If the key cannot be found in the dictionary, it is added to it.

It is Ok to provide a NULL value for val, but NULL values for the dictionary or the key are considered as errors: the function will return immediately in such a case.

Notice that if you dictionary\_set a variable to NULL, a call to dictionary\_get will return a NULL value: the variable will be found, and its value (NULL) is returned. In other words, setting the variable content to NULL is equivalent to deleting the variable from the dictionary. It is not possible (in this implementation) to have a key in the dictionary without value.

This function returns non-zero in case of failure.

#### 7.7.3.8 dictionary\_unset()

Delete a key in a dictionary.

#### **Parameters**

d	dictionary object to modify.
key	Key to remove.

### Returns

void

This function deletes a key in a dictionary. Nothing is done if the key cannot be found.

# 7.8 auxi/dictionary.h File Reference

Implements a dictionary for string variables.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <unistd.h>
#include "mempro.h"
#include "test.h"
```

Include dependency graph for dictionary.h: This graph shows which files directly or indirectly include this file:

### **Classes**

 struct \_dictionary\_ Dictionary object.

## **Typedefs**

 typedef struct \_dictionary\_ dictionary Dictionary object.

### **Functions**

• unsigned dictionary\_hash (const char \*key)

Compute the hash key for a string.

dictionary \* dictionary\_new (int size)

Create a new dictionary object.

· void dictionary\_del (dictionary \*vd)

Delete a dictionary object.

• char \* dictionary\_get (dictionary \*d, const char \*key, char \*def)

Get a value from a dictionary.

int dictionary\_set (dictionary \*vd, const char \*key, const char \*val)

Set a value in a dictionary.

void dictionary\_unset (dictionary \*d, const char \*key)

Delete a key in a dictionary.

• void dictionary\_dump (dictionary \*d, FILE \*out)

Dump a dictionary to an opened file pointer.

TestResult AK\_dictionary\_test ()

Function for testing the implementation.

### 7.8.1 Detailed Description

Implements a dictionary for string variables.

**Author** 

N. Devillard This module implements a simple dictionary object, i.e. a list of string/string associations. This object is useful to store e.g. informations retrieved from a configuration file (ini files).

## 7.8.2 Typedef Documentation

### 7.8.2.1 dictionary

```
typedef struct _dictionary_ dictionary
```

Dictionary object.

This object contains a list of string/string associations. Each association is identified by a unique string key. Looking up values in the dictionary is speeded up by the use of a (hopefully collision-AK\_free) hash function.

## 7.8.3 Function Documentation

## 7.8.3.1 AK\_dictionary\_test()

```
TestResult AK_dictionary_test ( )
```

Function for testing the implementation.

**Author** 

Marko Belusic

## 7.8.3.2 dictionary\_del()

```
void dictionary_del ( \label{eq:dictionary} \mbox{dictionary} \ * \ d \ )
```

Delete a dictionary object.

### **Parameters**

d dictionary object to deallocate.

Returns

void

Deallocate a dictionary object and all memory associated to it.

# 7.8.3.3 dictionary\_dump()

Dump a dictionary to an opened file pointer.

d	Dictionary to dump
f	Opened file pointer.

#### Returns

void

Dumps a dictionary onto an opened file pointer. Key pairs are printed out as [Key]=[Value], one per line. It is Ok to provide stdout or stderr as output file pointers.

#### 7.8.3.4 dictionary\_get()

Get a value from a dictionary.

#### **Parameters**

d	dictionary object to search.
key	Key to look for in the dictionary.
def	Default value to return if key not found.

#### Returns

1 pointer to internally allocated character string.

This function locates a key in a dictionary and returns a pointer to its value, or the passed 'def' pointer if no such key can be found in dictionary. The returned character pointer points to data internal to the dictionary object, you should not try to AK\_free it or modify it.

## 7.8.3.5 dictionary\_hash()

Compute the hash key for a string.

#### **Parameters**

key	Character string to use for key.
-----	----------------------------------

# Returns

1 unsigned int on at least 32 bits.

This hash function has been taken from an Article in Dr Dobbs Journal. This is normally a collision-AK\_free function, distributing keys evenly. The key is stored anyway in the struct so that collision can be avoided by comparing the key itself in last resort.

#### 7.8.3.6 dictionary\_new()

Create a new dictionary object.

#### **Parameters**

	size	Optional initial size of the dictionary.
--	------	--

#### Returns

1 newly allocated dictionary objet.

This function allocates a new dictionary object of given size and returns it. If you do not know in advance (roughly) the number of entries in the dictionary, give size=0.

### 7.8.3.7 dictionary\_set()

Set a value in a dictionary.

#### **Parameters**

d	dictionary object to modify.
key	Key to modify or add.
val	Value to add.

#### Returns

int 0 if Ok, anything else otherwise

If the given key is found in the dictionary, the associated value is replaced by the provided one. If the key cannot be found in the dictionary, it is added to it.

It is Ok to provide a NULL value for val, but NULL values for the dictionary or the key are considered as errors: the function will return immediately in such a case.

Notice that if you dictionary\_set a variable to NULL, a call to dictionary\_get will return a NULL value: the variable will be found, and its value (NULL) is returned. In other words, setting the variable content to NULL is equivalent to deleting the variable from the dictionary. It is not possible (in this implementation) to have a key in the dictionary without value.

This function returns non-zero in case of failure.

## 7.8.3.8 dictionary\_unset()

```
void dictionary_unset (  \frac{\text{dictionary} * d,}{\text{const char} * key} )
```

Delete a key in a dictionary.

### **Parameters**

d	dictionary object to modify.
key	Key to remove.

### Returns

void

This function deletes a key in a dictionary. Nothing is done if the key cannot be found.

# 7.9 auxi/iniparser.c File Reference

Parser for ini files.

```
#include <ctype.h>
#include "iniparser.h"
Include dependency graph for iniparser.c:
```

## **Macros**

- #define ASCIILINESZ (1024)
- #define INI\_INVALID\_KEY ((char\*)-1)

# **Typedefs**

• typedef enum \_line\_status\_ line\_status

### **Enumerations**

```
    enum _line_status_ {
    LINE_UNPROCESSED, LINE_ERROR, LINE_EMPTY, LINE_COMMENT,
    LINE_SECTION, LINE_VALUE }
```

#### **Functions**

int iniparser\_getnsec (dictionary \*d)

Get number of sections in a dictionary.

• char \* iniparser\_getsecname (dictionary \*d, int n)

Get name for section n in a dictionary.

void iniparser\_dump (dictionary \*d, FILE \*f)

Dump a dictionary to an opened file pointer.

void iniparser dump ini (dictionary \*d, FILE \*f)

Save a dictionary to a loadable ini file.

• void iniparser\_dumpsection\_ini (dictionary \*d, char \*s, FILE \*f)

Save a dictionary section to a loadable ini file.

int iniparser\_getsecnkeys (dictionary \*d, char \*s)

Get the number of keys in a section of a dictionary.

• char \*\* iniparser\_getseckeys (dictionary \*d, char \*s)

Get the number of keys in a section of a dictionary.

char \* iniparser\_getstring (dictionary \*d, const char \*key, char \*def)

Get the string associated to a key.

• int iniparser\_getint (dictionary \*d, const char \*key, int notfound)

Get the string associated to a key, convert to an int.

double iniparser getdouble (dictionary \*d, const char \*key, double notfound)

Get the string associated to a key, convert to a double.

int iniparser\_getboolean (dictionary \*d, const char \*key, int notfound)

Get the string associated to a key, convert to a boolean.

int iniparser\_find\_entry (dictionary \*ini, const char \*entry)

Finds out if a given entry exists in a dictionary.

int iniparser\_set (dictionary \*ini, const char \*entry, const char \*val)

Set an entry in a dictionary.

void iniparser\_unset (dictionary \*ini, const char \*entry)

Delete an entry in a dictionary.

dictionary \* iniparser\_load (const char \*ininame)

Parse an ini file and return an allocated dictionary object.

void iniparser\_AK\_freedict (dictionary \*d)

Free all memory associated to an ini dictionary.

- void AK inflate config ()
- TestResult AK\_iniparser\_test ()

Function for testing the implementation.

### **Variables**

- pthread\_mutex\_t iniParserMutex = PTHREAD\_MUTEX\_INITIALIZER
- dictionary \* AK\_config

### 7.9.1 Detailed Description

Parser for ini files.

**Author** 

N. Devillard

## 7.9.2 Macro Definition Documentation

#### 7.9.2.1 ASCIILINESZ

```
#define ASCIILINESZ (1024)
```

## 7.9.2.2 INI\_INVALID\_KEY

```
#define INI_INVALID_KEY ((char*)-1)
```

# 7.9.3 Typedef Documentation

## 7.9.3.1 line\_status

```
typedef enum _line_status_ line_status
```

This enum stores the status for each parsed line (internal use only).

# 7.9.4 Enumeration Type Documentation

# 7.9.4.1 \_line\_status\_

```
enum _line_status_
```

This enum stores the status for each parsed line (internal use only).

#### Enumerator

LINE_UNPROCESSED	
LINE_ERROR	
LINE_EMPTY	
LINE_COMMENT	
LINE_SECTION	
LINE_VALUE	

## 7.9.5 Function Documentation

## 7.9.5.1 AK\_inflate\_config()

```
void AK_inflate_config ( )
```

### 7.9.5.2 AK\_iniparser\_test()

```
TestResult AK_iniparser_test ( )
```

Function for testing the implementation.

Author

Marko Belusic

## 7.9.5.3 iniparser\_AK\_freedict()

```
void iniparser_AK_freedict ( \label{eq:dictionary} \ \textit{dictionary} \ \textit{* d} \ )
```

Free all memory associated to an ini dictionary.

**Parameters** 

```
d Dictionary to AK_free
```

Returns

void

Free all memory associated to an ini dictionary. It is mandatory to call this function before the dictionary object gets out of the current context.

## 7.9.5.4 iniparser\_dump()

```
void iniparser_dump ( \label{eq:dictionary * d, file * f } \mbox{ } file * f \mbox{ } )
```

Dump a dictionary to an opened file pointer.

#### **Parameters**

d	Dictionary to dump.
f	Opened file pointer to dump to.

#### Returns

void

This function prints out the contents of a dictionary, one element by line, onto the provided file pointer. It is OK to specify stderr or stdout as output files. This function is meant for debugging purposes mostly.

## 7.9.5.5 iniparser\_dump\_ini()

```
void iniparser_dump_ini ( \label{eq:dictionary * d, file * f } \mbox{ dictionary * d, } \mbox{ } \mb
```

Save a dictionary to a loadable ini file.

#### **Parameters**

d	Dictionary to dump
f	Opened file pointer to dump to

### Returns

void

This function dumps a given dictionary into a loadable ini file. It is Ok to specify stderr or stdout as output files.

### 7.9.5.6 iniparser\_dumpsection\_ini()

Save a dictionary section to a loadable ini file.

d	Dictionary to dump
s	Section name of dictionary to dump
f	Opened file pointer to dump to

#### Returns

void

This function dumps a given section of a given dictionary into a loadable ini file. It is Ok to specify stderr or stdout as output files.

#### 7.9.5.7 iniparser\_find\_entry()

Finds out if a given entry exists in a dictionary.

#### **Parameters**

ini	Dictionary to search
entry	Name of the entry to look for

#### Returns

integer 1 if entry exists, 0 otherwise

Finds out if a given entry exists in the dictionary. Since sections are stored as keys with NULL associated values, this is the only way of querying for the presence of sections in a dictionary.

#### 7.9.5.8 iniparser\_getboolean()

Get the string associated to a key, convert to a boolean.

#### **Parameters**

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

# Returns

integer

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

A true boolean is found if one of the following is matched:

- · A string starting with 'y'
- · A string starting with 'Y'
- · A string starting with 't'
- · A string starting with 'T'
- · A string starting with '1'

A false boolean is found if one of the following is matched:

- · A string starting with 'n'
- · A string starting with 'N'
- · A string starting with 'f'
- · A string starting with 'F'
- · A string starting with '0'

The notfound value returned if no boolean is identified, does not necessarily have to be 0 or 1.

#### 7.9.5.9 iniparser\_getdouble()

Get the string associated to a key, convert to a double.

#### **Parameters**

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

### Returns

double

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

### 7.9.5.10 iniparser\_getint()

Get the string associated to a key, convert to an int.

#### **Parameters**

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

#### Returns

integer

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

Supported values for integers include the usual C notation so decimal, octal (starting with 0) and hexadecimal (starting with 0x) are supported. Examples:

```
"42" -> 42 "042" -> 34 (octal -> decimal) "0x42" -> 66 (hexa -> decimal)
```

Warning: the conversion may overflow in various ways. Conversion is totally outsourced to strtol(), see the associated man page for overflow handling.

Credits: Thanks to A. Becker for suggesting strtol()

### 7.9.5.11 iniparser\_getnsec()

```
int iniparser_getnsec ( \label{eq:dictionary} \ \textit{d} \ \textit{o}
```

Get number of sections in a dictionary.

## **Parameters**

```
d Dictionary to examine
```

#### Returns

int Number of sections found in dictionary

This function returns the number of sections found in a dictionary. The test to recognize sections is done on the string stored in the dictionary: a section name is given as "section" whereas a key is stored as "section:key", thus the test looks for entries that do not contain a colon.

This clearly fails in the case a section name contains a colon, but this should simply be avoided.

This function returns -1 in case of error.

### 7.9.5.12 iniparser\_getseckeys()

```
char** iniparser_getseckeys (  \frac{\text{dictionary }*\ d,}{\text{char }*\ s}\ )
```

Get the number of keys in a section of a dictionary.

#### **Parameters**

d	Dictionary to examine
s	Section name of dictionary to examine

#### Returns

pointer to statically allocated character strings

This function queries a dictionary and finds all keys in a given section. Each pointer in the returned char pointer-to-pointer is pointing to a string allocated in the dictionary; do not AK\_free or modify them.

This function returns NULL in case of error.

### 7.9.5.13 iniparser\_getsecname()

Get name for section n in a dictionary.

#### **Parameters**

d	Dictionary to examine
n	Section number (from 0 to nsec-1).

### Returns

Pointer to char string

This function locates the n-th section in a dictionary and returns its name as a pointer to a string statically allocated inside the dictionary. Do not AK\_free or modify the returned string!

This function returns NULL in case of error.

### 7.9.5.14 iniparser\_getsecnkeys()

Get the number of keys in a section of a dictionary.

d	Dictionary to examine
s	Section name of dictionary to examine

#### Returns

Number of keys in section

### 7.9.5.15 iniparser\_getstring()

Get the string associated to a key.

#### **Parameters**

d	Dictionary to search	
key	Key string to look for	
def	Default value to return if key not found.	

#### Returns

pointer to statically allocated character string

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the pointer passed as 'def' is returned. The returned char pointer is pointing to a string allocated in the dictionary, do not AK\_free or modify it.

### 7.9.5.16 iniparser\_load()

Parse an ini file and return an allocated dictionary object.

## **Parameters**

ininame Name of the ini file to rea	ıd.
-------------------------------------	-----

#### Returns

Pointer to newly allocated dictionary

This is the parser for ini files. This function is called, providing the name of the file to be read. It returns a dictionary object that should not be accessed directly, but through accessor functions instead.

The returned dictionary must be AK\_freed using iniparser\_AK\_freedict().

## 7.9.5.17 iniparser\_set()

Set an entry in a dictionary.

#### **Parameters**

ini	Dictionary to modify.
entry	Entry to modify (entry name)
val	New value to associate to the entry.

### Returns

int 0 if Ok, -1 otherwise.

If the given entry can be found in the dictionary, it is modified to contain the provided value. If it cannot be found, -1 is returned. It is Ok to set val to NULL.

### 7.9.5.18 iniparser\_unset()

Delete an entry in a dictionary.

### **Parameters**

ini	Dictionary to modify
entry	Entry to delete (entry name)

### Returns

void

If the given entry can be found, it is deleted from the dictionary.

## 7.9.6 Variable Documentation

#### 7.9.6.1 AK\_config

```
dictionary* AK_config
```

#### 7.9.6.2 iniParserMutex

```
pthread_mutex_t iniParserMutex = PTHREAD_MUTEX_INITIALIZER
```

# 7.10 auxi/iniparser.h File Reference

Parser for ini files.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pthread.h>
#include "dictionary.h"
#include "mempro.h"
```

Include dependency graph for iniparser.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

int iniparser\_getnsec (dictionary \*d)

Get number of sections in a dictionary.

char \* iniparser\_getsecname (dictionary \*d, int n)

Get name for section n in a dictionary.

• void iniparser\_dump\_ini (dictionary \*d, FILE \*f)

Save a dictionary to a loadable ini file.

void iniparser\_dumpsection\_ini (dictionary \*d, char \*s, FILE \*f)

Save a dictionary section to a loadable ini file.

void iniparser\_dump (dictionary \*d, FILE \*f)

Dump a dictionary to an opened file pointer.

int iniparser\_getsecnkeys (dictionary \*d, char \*s)

Get the number of keys in a section of a dictionary.

char \*\* iniparser\_getseckeys (dictionary \*d, char \*s)

Get the number of keys in a section of a dictionary.

• char \* iniparser\_getstring (dictionary \*d, const char \*key, char \*def)

Get the string associated to a key.

int iniparser\_getint (dictionary \*d, const char \*key, int notfound)

Get the string associated to a key, convert to an int.

double iniparser\_getdouble (dictionary \*d, const char \*key, double notfound)

Get the string associated to a key, convert to a double.

• int iniparser\_getboolean (dictionary \*d, const char \*key, int notfound)

Get the string associated to a key, convert to a boolean.

• int iniparser set (dictionary \*ini, const char \*entry, const char \*val)

Set an entry in a dictionary.

void iniparser\_unset (dictionary \*ini, const char \*entry)

Delete an entry in a dictionary.

• int iniparser\_find\_entry (dictionary \*ini, const char \*entry)

Finds out if a given entry exists in a dictionary.

dictionary \* iniparser\_load (const char \*ininame)

Parse an ini file and return an allocated dictionary object.

void iniparser\_AK\_freedict (dictionary \*d)

Free all memory associated to an ini dictionary.

- void AK inflate config ()
- TestResult AK iniparser test ()

Function for testing the implementation.

## **Variables**

• dictionary \* AK\_config

# 7.10.1 Detailed Description

Parser for ini files.

Author

N. Devillard

### 7.10.2 Function Documentation

# 7.10.2.1 AK\_inflate\_config()

```
void AK_inflate_config ( )
```

## 7.10.2.2 AK\_iniparser\_test()

```
TestResult AK_iniparser_test ( )
```

Function for testing the implementation.

Author

Marko Belusic

# 7.10.2.3 iniparser\_AK\_freedict()

```
void iniparser_AK_freedict ( \label{eq:dictionary} \ \textit{dictionary} \ \textit{* d} \ )
```

Free all memory associated to an ini dictionary.

# **Parameters**

d Dictionary to AK\_free

#### Returns

void

Free all memory associated to an ini dictionary. It is mandatory to call this function before the dictionary object gets out of the current context.

#### 7.10.2.4 iniparser\_dump()

```
void iniparser_dump ( \label{eq:dictionary * d, file * f } \mbox{dictionary * $d$,} FILE * f )
```

Dump a dictionary to an opened file pointer.

#### **Parameters**

d	Dictionary to dump.
f	Opened file pointer to dump to.

#### Returns

void

This function prints out the contents of a dictionary, one element by line, onto the provided file pointer. It is OK to specify stderr or stdout as output files. This function is meant for debugging purposes mostly.

### 7.10.2.5 iniparser\_dump\_ini()

Save a dictionary to a loadable ini file.

#### **Parameters**

d	Dictionary to dump
f	Opened file pointer to dump to

#### Returns

void

This function dumps a given dictionary into a loadable ini file. It is Ok to specify stderr or stdout as output files.

#### 7.10.2.6 iniparser\_dumpsection\_ini()

Save a dictionary section to a loadable ini file.

#### **Parameters**

d	Dictionary to dump
s	Section name of dictionary to dump
f Opened file pointer to dump to	

#### Returns

void

This function dumps a given section of a given dictionary into a loadable ini file. It is Ok to specify stderr or stdout as output files.

### 7.10.2.7 iniparser\_find\_entry()

Finds out if a given entry exists in a dictionary.

### **Parameters**

ini	Dictionary to search
entry	Name of the entry to look for

#### Returns

integer 1 if entry exists, 0 otherwise

Finds out if a given entry exists in the dictionary. Since sections are stored as keys with NULL associated values, this is the only way of querying for the presence of sections in a dictionary.

# 7.10.2.8 iniparser\_getboolean()

Get the string associated to a key, convert to a boolean.

#### **Parameters**

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

#### Returns

integer

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

A true boolean is found if one of the following is matched:

- · A string starting with 'y'
- · A string starting with 'Y'
- · A string starting with 't'
- · A string starting with 'T'
- A string starting with '1'

A false boolean is found if one of the following is matched:

- · A string starting with 'n'
- · A string starting with 'N'
- · A string starting with 'f'
- · A string starting with 'F'
- · A string starting with '0'

The notfound value returned if no boolean is identified, does not necessarily have to be 0 or 1.

## 7.10.2.9 iniparser\_getdouble()

Get the string associated to a key, convert to a double.

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

#### Returns

double

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

#### 7.10.2.10 iniparser\_getint()

Get the string associated to a key, convert to an int.

#### **Parameters**

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

#### Returns

integer

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

Supported values for integers include the usual C notation so decimal, octal (starting with 0) and hexadecimal (starting with 0x) are supported. Examples:

```
 "42" -> 42
```

```
    "042" -> 34 (octal -> decimal)
```

• "0x42" -> 66 (hexa -> decimal)

Warning: the conversion may overflow in various ways. Conversion is totally outsourced to strtol(), see the associated man page for overflow handling.

Credits: Thanks to A. Becker for suggesting strtol()

d	Dictionary to search
key	Key string to look for
notfound	Value to return in case of error

#### Returns

integer

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the notfound value is returned.

Supported values for integers include the usual C notation so decimal, octal (starting with 0) and hexadecimal (starting with 0x) are supported. Examples:

```
"42" -> 42 "042" -> 34 (octal -> decimal) "0x42" -> 66 (hexa -> decimal)
```

Warning: the conversion may overflow in various ways. Conversion is totally outsourced to strtol(), see the associated man page for overflow handling.

Credits: Thanks to A. Becker for suggesting strtol()

## 7.10.2.11 iniparser\_getnsec()

```
int iniparser_getnsec ( \label{eq:dictionary} \ * \ d \ )
```

Get number of sections in a dictionary.

#### **Parameters**

```
d Dictionary to examine
```

### Returns

int Number of sections found in dictionary

This function returns the number of sections found in a dictionary. The test to recognize sections is done on the string stored in the dictionary: a section name is given as "section" whereas a key is stored as "section:key", thus the test looks for entries that do not contain a colon.

This clearly fails in the case a section name contains a colon, but this should simply be avoided.

This function returns -1 in case of error.

#### 7.10.2.12 iniparser\_getseckeys()

Get the number of keys in a section of a dictionary.

d	Dictionary to examine
s	Section name of dictionary to examine

#### Returns

pointer to statically allocated character strings

This function queries a dictionary and finds all keys in a given section. Each pointer in the returned char pointer-to-pointer is pointing to a string allocated in the dictionary; do not AK\_free or modify them.

This function returns NULL in case of error.

### 7.10.2.13 iniparser\_getsecname()

Get name for section n in a dictionary.

#### **Parameters**

d	Dictionary to examine
n	Section number (from 0 to nsec-1).

#### Returns

Pointer to char string

This function locates the n-th section in a dictionary and returns its name as a pointer to a string statically allocated inside the dictionary. Do not AK\_free or modify the returned string!

This function returns NULL in case of error.

### 7.10.2.14 iniparser\_getsecnkeys()

Get the number of keys in a section of a dictionary.

#### **Parameters**

d	Dictionary to examine
s	Section name of dictionary to examine

### Returns

Number of keys in section

#### 7.10.2.15 iniparser\_getstring()

Get the string associated to a key.

#### **Parameters**

(	d	Dictionary to search
1	key	Key string to look for
def Default value to return if key not four		Default value to return if key not found.

#### Returns

pointer to statically allocated character string

This function queries a dictionary for a key. A key as read from an ini file is given as "section:key". If the key cannot be found, the pointer passed as 'def' is returned. The returned char pointer is pointing to a string allocated in the dictionary, do not AK\_free or modify it.

### 7.10.2.16 iniparser\_load()

Parse an ini file and return an allocated dictionary object.

### **Parameters**

ininame	Name of the ini file to read.

### Returns

Pointer to newly allocated dictionary

This is the parser for ini files. This function is called, providing the name of the file to be read. It returns a dictionary object that should not be accessed directly, but through accessor functions instead.

The returned dictionary must be AK\_freed using iniparser\_AK\_freedict().

### 7.10.2.17 iniparser\_set()

Set an entry in a dictionary.

#### **Parameters**

ini	Dictionary to modify.	
entry	Entry to modify (entry name)	
val	New value to associate to the entry.	

#### Returns

```
int 0 if Ok, -1 otherwise.
```

If the given entry can be found in the dictionary, it is modified to contain the provided value. If it cannot be found, -1 is returned. It is Ok to set val to NULL.

# 7.10.2.18 iniparser\_unset()

Delete an entry in a dictionary.

#### **Parameters**

ini	Dictionary to modify
entry	Entry to delete (entry name)

## Returns

void

If the given entry can be found, it is deleted from the dictionary.

## 7.10.3 Variable Documentation

# 7.10.3.1 AK\_config

```
dictionary* AK_config
```

# 7.11 auxi/mempro.c File Reference

```
#include "mempro.h"
Include dependency graph for mempro.c:
```

#### **Functions**

 void AK\_debmod\_d (AK\_debmod\_state \*ds, const char \*message) Function prints debug message [private function]. void AK debmod dv (AK debmod state \*ds, const char \*format,...) Function prints debug message [private function]. void AK\_debmod\_enter\_critical\_sec (AK\_debmod\_state \*ds) Reserves ds for use [private function]. void AK debmod leave critical sec (AK debmod state \*ds) Makes ds available [private function]. AK\_debmod\_state \* AK\_debmod\_init (void) Initializes debug mode structure [public function]. void AK\_debmod\_die (AK\_debmod\_state \*ds) Destroy debug mode state (call before main() exit) [public function]. void \* AK\_debmod\_calloc (AK\_debmod\_state \*ds, uint32\_t size) Allocates memory [private function]. void AK\_debmod\_free (AK\_debmod\_state \*ds, void \*memory) Frees memory allocated with debmod\_alloc [private function]. void \* AK\_calloc (size\_t num, size\_t size) Allocates memory (see calloc) [public function]. void \* AK\_malloc (size\_t size) Allocate memory (see malloc) [public function]. void AK free (void \*ptr) Free memory at ptr (see free) [public function]. void \* AK\_realloc (void \*ptr, size\_t size) Reallocates memory (see realloc) [public function]. void AK write protect (void \*memory) Function write-protects memory [public function]. void AK write unprotect (void \*memory) Function write-unprotects memory [public function]. void AK check for writes (void) Marks pages dirty if there were writes between calls to this function. int32\_t AK\_debmod\_func\_id (AK\_debmod\_state \*ds, const char \*func\_name) Returns function id for given func name. const char \* AK\_debmod\_func\_get\_name (AK\_debmod\_state \*ds, int32\_t function\_id) Lookup function name [private function]. int32\_t AK\_debmod\_func\_add (AK\_debmod\_state \*ds, const char \*func\_name) Adds function name to list [private function]. void AK\_debmod\_fstack\_push (AK\_debmod\_state \*ds, int32\_t func\_id) Push function id on stack [private function]. • int32 t AK debmod fstack pop (AK debmod state \*ds) Pops function id from stack [private function]. void AK debmod function current (AK debmod state \*ds, int32 t new function id) Sets current function [private function]. • void AK debmod function prologue (const char \*func name, const char \*source file, int source line) Not for direct use (only with macro AK\_PRO). Marks function prologue. void AK debmod log memory alloc (int32 t func id) print debmod information on function [private function] • void AK debmod function epilogue (const char \*func name, const char \*source file, int source line) Not for direct use (only with macro AK\_EPI). Marks function epilogue. void AK\_debmod\_print\_function\_use (const char \*func\_name, uint8\_t in\_recur)

Print function dependency [private function].

void AK\_print\_function\_use (const char \*func\_name)

Print function dependency [public function].

• void AK\_print\_function\_uses ()

Print function dependency for all functions [public function].

• void AK\_print\_active\_functions ()

Print all detected functions.

• size\_t AK\_fwrite (const void \*buf, size\_t size, size\_t count, FILE \*fp)

Write to a file from a buffer (see fwrite) [public function].

• size\_t AK\_fread (void \*buf, size\_t size, size\_t count, FILE \*fp)

Read from a file (see fread) [public function].

void AK\_mempro\_test ()

Test function.

# 7.11.1 Detailed Description

Implementation of the memory wrappers and debug mode of Kalashnikov DB.

# 7.11.2 Function Documentation

# 7.11.2.1 AK\_calloc()

Allocates memory (see calloc) [public function].

Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

num	number of elements
size	of element in bytes

# Returns

allocated memory or NULL

# 7.11.2.2 AK\_check\_for\_writes()

Marks pages dirty if there were writes between calls to this function.

**Author** 

Marin Rukavina, Mislav Bozicevic

Returns

void

## 7.11.2.3 AK\_debmod\_calloc()

Allocates memory [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
size	in bytes to allocate

#### Returns

pointer to allocated memory or NULL

## 7.11.2.4 AK\_debmod\_d()

Function prints debug message [private function].

Author

## **Parameters**

ds	debug mode state
message	string to print

#### Returns

void

# 7.11.2.5 AK\_debmod\_die()

```
void AK_debmod_die (  {\rm AK\_debmod\_state} \ * \ ds \ )
```

Destroy debug mode state (call before main() exit) [public function].

## **Author**

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

```
ds debug mode state
```

#### Returns

void

# 7.11.2.6 AK\_debmod\_dv()

Function prints debug message [private function].

#### **Author**

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds	debug mode state	
format	format string like printf	

#### Returns

void

# 7.11.2.7 AK\_debmod\_enter\_critical\_sec()

```
void AK_debmod_enter_critical_sec ( {\tt AK\_debmod\_state} \ * \ ds \ )
```

Reserves ds for use [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

```
ds debug mode state
```

## Returns

void

# 7.11.2.8 AK\_debmod\_free()

Frees memory allocated with debmod\_alloc [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
memory	

#### Returns

void

# 7.11.2.9 AK\_debmod\_fstack\_pop()

```
int32_t AK_debmod_fstack_pop (  {\rm AK\_debmod\_state} \ * \ ds \ )
```

Pops function id from stack [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

## **Parameters**

```
ds debug mode state
```

#### Returns

function id popped

# 7.11.2.10 AK\_debmod\_fstack\_push()

Push function id on stack [private function].

Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
func⊷	function id
_id	

Returns

void

## 7.11.2.11 AK\_debmod\_func\_add()

Adds function name to list [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
func_name	

#### Returns

id for added function name

# 7.11.2.12 AK\_debmod\_func\_get\_name()

Lookup function name [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds	debug mode state
function←	
_id	

# Returns

function name for given function\_id

# 7.11.2.13 AK\_debmod\_func\_id()

Returns function id for given func\_name.

Author

#### **Parameters**

ds	debug mode state
func_name	function name [private function]

#### Returns

function id

# 7.11.2.14 AK\_debmod\_function\_current()

Sets current function [private function].

#### Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds	debug mode state
new_function←	
_id	

#### Returns

void

# 7.11.2.15 AK\_debmod\_function\_epilogue()

Not for direct use (only with macro AK\_EPI). Marks function epilogue.

## Author

## **Parameters**

func_name	function name as in source
source_file	file name where function is defined
source_line	line from which this function is called

## Returns

void

# 7.11.2.16 AK\_debmod\_function\_prologue()

Not for direct use (only with macro AK\_PRO). Marks function prologue.

## Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

func_name	function name as in source
source_file	file name where function is defined
source_line	line from which this function is called

# Returns

void

# 7.11.2.17 AK\_debmod\_init()

Initializes debug mode structure [public function].

# Author

Marin Rukavina, Mislav Bozicevic

# Returns

initialized debug mode state

## 7.11.2.18 AK\_debmod\_leave\_critical\_sec()

```
void AK_debmod_leave_critical_sec ( \label{eq:ak_debmod_state} \texttt{*} \ ds \ )
```

Makes ds available [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds debug mode state

#### Returns

void

# 7.11.2.19 AK\_debmod\_log\_memory\_alloc()

print debmod information on function [private function]

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

func	$\leftarrow$	calling function id
_id		

Returns

void

# 7.11.2.20 AK\_debmod\_print\_function\_use()

Print function dependency [private function].

## Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

func_name	function name
in_recur	called in recursion

## Returns

void

# 7.11.2.21 AK\_fread()

Read from a file (see fread) [public function].

**Author** 

Marin Rukavina, Mislav Bozicevic

## Returns

number of items read

# 7.11.2.22 AK\_free()

```
void AK_free ( \mbox{void} \ * \ \mbox{\it ptr} \ )
```

Free memory at ptr (see free) [public function].

Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ptr pointer to m	emory
ptr   pointer to m	emory

Returns

void

# 7.11.2.23 AK\_fwrite()

Write to a file from a buffer (see fwrite) [public function].

**Author** 

Marin Rukavina, Mislav Bozicevic

Returns

number of items written

# 7.11.2.24 AK\_malloc()

Allocate memory (see malloc) [public function].

Author

Marin Rukavina, Mislav Bozicevic

**Parameters** 

size of memory to allocate in bytes

Returns

allocated memory or NULL

# 7.11.2.25 AK\_mempro\_test()

```
void AK_mempro_test ( )
```

Test function.

Author

Ivan Kristo

# 7.11.2.26 AK\_print\_active\_functions()

```
void AK_print_active_functions ( )
```

Print all detected functions.

Author

Marin Rukavina, Mislav Bozicevic

Returns

void

# 7.11.2.27 AK\_print\_function\_use()

Print function dependency [public function].

Author

Marin Rukavina, Mislav Bozicevic

**Parameters** 

func name	function name

Returns

void

# 7.11.2.28 AK\_print\_function\_uses()

```
void AK_print_function_uses ( )
```

Print function dependency for all functions [public function].

**Author** 

Marin Rukavina, Mislav Bozicevic

Returns

void

## 7.11.2.29 AK\_realloc()

Reallocates memory (see realloc) [public function].

Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ptr	old memory
size	new size

Returns

reallocated memory or NULL

## 7.11.2.30 AK\_write\_protect()

Function write-protects memory [public function].

Author

#### **Parameters**

memory

## Returns

void

# 7.11.2.31 AK\_write\_unprotect()

Function write-unprotects memory [public function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

memory

#### Returns

void

# 7.12 auxi/mempro.h File Reference

```
#include <stdio.h>
#include <stdint.h>
#include <stdlib.h>
#include <string.h>
#include <assert.h>
#include <time.h>
#include <stdarg.h>
Include dependency graph for mempro.h:
```

## **Classes**

• struct AK\_debmod\_state

Global structure that holds all relevant information for the debug mode and related functionality.

#### **Macros**

```
    #define NEW(type, type_size) (calloc(type_size, sizeof(type)))

    #define AK_INLINE __inline__

    • #define AK_DEBMOD_ON 0
          Zero to switch memory protection and debug mode off.

    #define AK DEBMOD PRINT 0

          Defines if the debug mode messages are going to be printed.

    #define AK DEBMOD PAGES NUM 8192

          Defines the total available memory pages for allocation.

    #define AK DEBMOD MAX WRITE DETECTIONS (AK DEBMOD PAGES NUM * 10)

          Defines the maximum number of memory write detections.

    #define AK DEBMOD STACKSIZE AK DEBMOD PAGES NUM

          Defines the monitored functions stack.

    #define AK_DEBMOD_MAX_FUNCTIONS 500

          Defines the maximum number of function names in the application.

    #define AK DEBMOD MAX FUNC NAME 80

          Defines the maximum function name length possible.
    #define AK_PRO AK_debmod_function_prologue(__func__, __FILE__, __LINE__);
         Mandatory function prologue for all functions (AK_debmod and related functions are excluded). Put this macro after
          variable declarations, before any function instruction.
    #define AK_EPI AK_debmod_function_epilogue(__func__, __FILE__, __LINE__);
         Mandatory function epilogue for all functions (AK debmod and related functions are excluded). Put this macro after
          last function instruction, before every return statement.
Functions

    void AK_debmod_d (AK_debmod_state *, const char *)

          Function prints debug message [private function].

    void AK_debmod_dv (AK_debmod_state *, const char *,...)

          Function prints debug message [private function].

    void AK_debmod_enter_critical_sec (AK_debmod_state *)

          Reserves ds for use [private function].

    void AK_debmod_leave_critical_sec (AK_debmod_state *)

         Makes ds available [private function].

    AK_debmod_state * AK_debmod_init (void)

          Initializes debug mode structure [public function].

    void AK debmod die (AK debmod state *)

          Destroy debug mode state (call before main() exit) [public function].

    void * AK_debmod_calloc (AK_debmod_state *, uint32_t)

          Allocates memory [private function].

    void AK debmod free (AK debmod state *, void *)

          Frees memory allocated with debmod_alloc [private function].

    void * AK_calloc (size_t, size_t)

          Allocates memory (see calloc) [public function].
```

void \* AK\_malloc (size\_t)

void \* AK realloc (void \*, size t)

void AK free (void \*)

Allocate memory (see malloc) [public function].

Free memory at ptr (see free) [public function].

Reallocates memory (see realloc) [public function].

```
    void AK_write_protect (void *)

      Function write-protects memory [public function].

    void AK write unprotect (void *)

     Function write-unprotects memory [public function].

    void AK check for writes (void)

      Marks pages dirty if there were writes between calls to this function.
• int32 t AK debmod func id (AK debmod state *, const char *)
      Returns function id for given func_name.

    const char * AK_debmod_func_get_name (AK_debmod_state *, int32_t)

     Lookup function name [private function].

    int32 t AK debmod func add (AK debmod state *, const char *)

      Adds function name to list [private function].

    void AK_debmod_fstack_push (AK_debmod_state *, int32_t)

      Push function id on stack [private function].

    int32_t AK_debmod_fstack_pop (AK_debmod_state *)

      Pops function id from stack [private function].

    void AK_debmod_function_current (AK_debmod_state *, int32_t)

      Sets current function [private function].

    void AK_debmod_function_prologue (const char *, const char *, int)

      Not for direct use (only with macro AK PRO). Marks function prologue.

    void AK_debmod_function_epilogue (const char *, const char *, int)

     Not for direct use (only with macro AK_EPI). Marks function epilogue.

    void AK debmod log memory alloc (int32 t)

      print debmod information on function [private function]

    void AK_debmod_print_function_use (const char *, uint8_t)

      Print function dependency [private function].

    void AK print function use (const char *)

      Print function dependency [public function].

    void AK print function uses ()

      Print function dependency for all functions [public function].

    void AK print active functions ()

      Print all detected functions.
• void AK mempro test ()
      Test function.
```

## **Variables**

AK\_debmod\_state \* AK\_DEBMOD\_STATE

## 7.12.1 Detailed Description

Data structures, includes, macros and declarations for the memory wrappers and debug mode of Kalashnikov DB.

#### 7.12.2 Macro Definition Documentation

## 7.12.2.1 AK\_DEBMOD\_MAX\_FUNC\_NAME

```
#define AK_DEBMOD_MAX_FUNC_NAME 80
```

Defines the maximum function name length possible.

#### 7.12.2.2 AK\_DEBMOD\_MAX\_FUNCTIONS

```
#define AK_DEBMOD_MAX_FUNCTIONS 500
```

Defines the maximum number of function names in the application.

# 7.12.2.3 AK\_DEBMOD\_MAX\_WRITE\_DETECTIONS

```
#define AK_DEBMOD_MAX_WRITE_DETECTIONS (AK_DEBMOD_PAGES_NUM * 10)
```

Defines the maximum number of memory write detections.

# 7.12.2.4 AK\_DEBMOD\_ON

```
#define AK_DEBMOD_ON 0
```

Zero to switch memory protection and debug mode off.

# 7.12.2.5 AK\_DEBMOD\_PAGES\_NUM

```
#define AK_DEBMOD_PAGES_NUM 8192
```

Defines the total available memory pages for allocation.

# 7.12.2.6 AK\_DEBMOD\_PRINT

```
#define AK_DEBMOD_PRINT 0
```

Defines if the debug mode messages are going to be printed.

## 7.12.2.7 AK\_DEBMOD\_STACKSIZE

```
#define AK_DEBMOD_STACKSIZE AK_DEBMOD_PAGES_NUM
```

Defines the monitored functions stack.

## 7.12.2.8 AK\_EPI

```
#define AK_EPI AK_debmod_function_epilogue(__func__, __FILE__, __LINE__);
```

Mandatory function epilogue for all functions (AK\_debmod and related functions are excluded). Put this macro after last function instruction, before every return statement.

# 7.12.2.9 AK\_INLINE

```
#define AK_INLINE __inline__
```

## 7.12.2.10 AK\_PRO

```
#define AK_PRO AK_debmod_function_prologue(__func__, __FILE__, __LINE__);
```

Mandatory function prologue for all functions (AK\_debmod and related functions are excluded). Put this macro after variable declarations, before any function instruction.

## 7.12.2.11 NEW

```
#define NEW( type, \\ type\_size \ ) \ (calloc(type\_size, \ sizeof(type)))
```

# 7.12.3 Function Documentation

## 7.12.3.1 AK\_calloc()

Allocates memory (see calloc) [public function].

Author

#### **Parameters**

num	number of elements
size	of element in bytes

## Returns

allocated memory or NULL

# 7.12.3.2 AK\_check\_for\_writes()

Marks pages dirty if there were writes between calls to this function.

Author

Marin Rukavina, Mislav Bozicevic

Returns

void

# 7.12.3.3 AK\_debmod\_calloc()

Allocates memory [private function].

Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
size	in bytes to allocate

#### Returns

pointer to allocated memory or NULL

# 7.12.3.4 AK\_debmod\_d()

Function prints debug message [private function].

## Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds	debug mode state
message	string to print

#### Returns

void

# 7.12.3.5 AK\_debmod\_die()

Destroy debug mode state (call before main() exit) [public function].

#### Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds debug mode state

## Returns

void

# 7.12.3.6 AK\_debmod\_dv()

Function prints debug message [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
format	format string like printf

#### Returns

void

# 7.12.3.7 AK\_debmod\_enter\_critical\_sec()

```
void AK_debmod_enter_critical_sec ( {\tt AK\_debmod\_state} \ * \ ds \ )
```

Reserves ds for use [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

```
ds debug mode state
```

#### Returns

void

## 7.12.3.8 AK\_debmod\_free()

Frees memory allocated with debmod\_alloc [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ds	debug mode state
memory	

#### Returns

void

# 7.12.3.9 AK\_debmod\_fstack\_pop()

Pops function id from stack [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

## **Parameters**

```
ds debug mode state
```

# Returns

function id popped

# 7.12.3.10 AK\_debmod\_fstack\_push()

Push function id on stack [private function].

## Author

## **Parameters**

ds	debug mode state		
func⇔	function id		
_id			

#### Returns

void

# 7.12.3.11 AK\_debmod\_func\_add()

Adds function name to list [private function].

#### Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds	debug mode state
func_name	

## Returns

id for added function name

# 7.12.3.12 AK\_debmod\_func\_get\_name()

Lookup function name [private function].

## Author

#### **Parameters**

ds	debug mode state
function←	
_id	

#### Returns

function name for given function\_id

# 7.12.3.13 AK\_debmod\_func\_id()

Returns function id for given func\_name.

#### **Author**

Marin Rukavina, Mislav Bozicevic

## **Parameters**

ds	debug mode state	
func_name	function name [private function]	

## Returns

function id

## 7.12.3.14 AK\_debmod\_function\_current()

Sets current function [private function].

#### **Author**

#### **Parameters**

ds	debug mode state
new_function←	
_id	

#### Returns

void

# 7.12.3.15 AK\_debmod\_function\_epilogue()

Not for direct use (only with macro AK\_EPI). Marks function epilogue.

## Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

func_name	function name as in source
source_file   file name where function is defir	
source_line	line from which this function is called

#### Returns

void

# 7.12.3.16 AK\_debmod\_function\_prologue()

Not for direct use (only with macro AK\_PRO). Marks function prologue.

## **Author**

#### **Parameters**

func_name	function name as in source	
source_file	file name where function is defined	
source_line	line from which this function is called	

## Returns

void

# 7.12.3.17 AK\_debmod\_init()

Initializes debug mode structure [public function].

Author

Marin Rukavina, Mislav Bozicevic

# Returns

initialized debug mode state

# 7.12.3.18 AK\_debmod\_leave\_critical\_sec()

```
void AK_debmod_leave_critical_sec ( \label{eq:ak_debmod_state} \texttt{*} \ ds \ )
```

Makes ds available [private function].

Author

Marin Rukavina, Mislav Bozicevic

## **Parameters**

## Returns

void

# 7.12.3.19 AK\_debmod\_log\_memory\_alloc()

print debmod information on function [private function]

**Author** 

Marin Rukavina, Mislav Bozicevic

## **Parameters**

func⇔	calling function id
_id	

#### Returns

void

# 7.12.3.20 AK\_debmod\_print\_function\_use()

Print function dependency [private function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

func_name	function name		
in_recur	called in recursion		

## Returns

void

# 7.12.3.21 AK\_free()

```
void AK_free (
     void * ptr )
```

Free memory at ptr (see free) [public function].

Marin Rukavina, Mislav Bozicevic

## **Parameters**

```
ptr pointer to memory
```

# Returns

void

# 7.12.3.22 AK\_malloc()

Allocate memory (see malloc) [public function].

Author

Marin Rukavina, Mislav Bozicevic

# **Parameters**

|--|

## Returns

allocated memory or NULL

# 7.12.3.23 AK\_mempro\_test()

```
void AK_mempro_test ( )
```

Test function.

Author

Ivan Kristo

# 7.12.3.24 AK\_print\_active\_functions()

```
void AK\_print\_active\_functions ( )
```

Print all detected functions.

Author

Marin Rukavina, Mislav Bozicevic

Returns

void

## 7.12.3.25 AK\_print\_function\_use()

Print function dependency [public function].

**Author** 

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

|--|

Returns

void

## 7.12.3.26 AK\_print\_function\_uses()

```
void AK_print_function_uses ( )
```

Print function dependency for all functions [public function].

Author

Marin Rukavina, Mislav Bozicevic

Returns

void

# 7.12.3.27 AK\_realloc()

Reallocates memory (see realloc) [public function].

Author

Marin Rukavina, Mislav Bozicevic

#### **Parameters**

ptr	old memory
size	new size

#### Returns

reallocated memory or NULL

## 7.12.3.28 AK\_write\_protect()

```
void AK_write_protect (
     void * memory )
```

Function write-protects memory [public function].

Author

Marin Rukavina, Mislav Bozicevic

**Parameters** 

memory

Returns

void

# 7.12.3.29 AK\_write\_unprotect()

Function write-unprotects memory [public function].

Author

Marin Rukavina, Mislav Bozicevic

**Parameters** 

memory

Returns

void

# 7.12.4 Variable Documentation

# 7.12.4.1 AK\_DEBMOD\_STATE

AK\_debmod\_state\* AK\_DEBMOD\_STATE

# 7.13 auxi/observable.c File Reference

#include "./observable.h"
Include dependency graph for observable.c:

#### **Classes**

- struct \_notifyDetails
- struct TypeObservable
- struct TypeObserver

# **Typedefs**

```

### **Functions**

char \* AK\_get\_table\_atribute\_types (char \*tblName)

returns a string containing attribute types for the supplied table name, seperated by ATTR\_DELIMITER

• int create\_header\_test (char \*tbl\_name, char \*\*attr\_name, int \_num, int \*\_type)

Function for creating test table header.

• int insert\_data\_test (char \*tbl\_name, char \*\*attr\_name, char \*\*attr\_value, int \_num, int \*\_type)

Function for inserting test data into the table (needed for python testing)

• int selection\_test (char \*src\_table, char \*dest\_table, char \*\*sel\_query, int \_num, int \*\_type)

Function for selection operator on one table.

• int get\_column\_test (int num, char \*tbl)

Function that prints the requested column.

• int get\_row\_test (int num, char \*tbl)

Function that prints the requested row.

void AK\_create\_test\_tables ()

Function that calls all functions for creating test tables in this file.

• void AK\_create\_test\_table\_student ()

Creates table "student" and fills it with arbitrary data, for testing purposes.

void AK\_create\_test\_table\_professor ()

Creates table "professor" and fills it with arbitrary data, for testing purposes.

void AK\_create\_test\_table\_professor2 ()

Creates table "professor2" and fills it with arbitrary data, for testing purposes.

void AK\_create\_test\_table\_assistant ()

Creates table "assistant" and fills it with arbitrary data, for testing purposes.

void AK\_create\_test\_table\_employee ()

Creates table "employee" and fills it with arbitrary data, for testing purposes.

void AK\_create\_test\_table\_department ()

Creates table "department" and fills it with arbitrary data, for testing purposes.

void AK\_create\_test\_table\_course ()

Creates table "Course" and fills it with arbitrary data, for testing purposes.

# 7.17.1 Detailed Description

Provides functions for testing purposes

## 7.17.2 Function Documentation

# 7.17.2.1 AK\_create\_test\_table\_assistant()

```
void AK_create_test_table_assistant ( )
```

Creates table "assistant" and fills it with arbitrary data, for testing purposes.

**Author** 

Žan Žlender

Returns

No return value

## 7.17.2.2 AK\_create\_test\_table\_course()

```
void AK_create_test_table_course ( )
```

Creates table "Course" and fills it with arbitrary data, for testing purposes.

**Author** 

Žan Žlender

Returns

No return value

## 7.17.2.3 AK\_create\_test\_table\_department()

```
void AK_create_test_table_department ( )
```

Creates table "department" and fills it with arbitrary data, for testing purposes.

Author

Žan Žlender

Returns

No return value

# 7.17.2.4 AK\_create\_test\_table\_employee()

```
void AK_create_test_table_employee ( )
```

Creates table "employee" and fills it with arbitrary data, for testing purposes.

**Author** 

Žan Žlender

Returns

No return value

# 7.17.2.5 AK\_create\_test\_table\_professor()

```
void AK_create_test_table_professor ( )
```

Creates table "professor" and fills it with arbitrary data, for testing purposes.

Author

Žan Žlender

Returns

No return value

# 7.17.2.6 AK\_create\_test\_table\_professor2()

```
void AK_create_test_table_professor2 ( )
```

Creates table "professor2" and fills it with arbitrary data, for testing purposes.

Author

Žan Žlender

Returns

No return value

# 7.17.2.7 AK\_create\_test\_table\_student()

```
void AK_create_test_table_student ( )
```

Creates table "student" and fills it with arbitrary data, for testing purposes.

Author

Žan Žlender

Returns

No return value

# 7.17.2.8 AK\_create\_test\_tables()

```
void AK_create_test_tables ( )
```

Function that calls all functions for creating test tables in this file.

Function for creating test tables.

Author

Dino Laktašić edited by Žan Žlender @2022

Returns

No return value

# 7.17.2.9 AK\_get\_table\_atribute\_types()

returns a string containing attribute types for the supplied table name, seperated by ATTR\_DELIMITER

Author

Goran Štrok

### **Parameters**

tblName | name of the table for which the attribute types will be returned

# 7.17.2.10 create\_header\_test()

Function for creating test table header.

Author

Luka Rajcevic

### **Parameters**

tbl_name	- name of the table for which the header will be created
attr_name	- array of attribute names
_num	- number of attributes
_type	- array of attribute types (eg. TYPE_INT, TYPE_VARCHAR, etc.)

## Returns

1 if ok, 0 otherwise

# 7.17.2.11 get\_column\_test()

```
int get_column_test (
          int num,
          char * tbl )
```

Function that prints the requested column.

Author

Luka Rajcevic

## Returns

1 if column is found, 0 otherwise

## **Parameters**

num	- 0 based index of column
tbl	- name of the table

# 7.17.2.12 get\_row\_test()

Function that prints the requested row.

Author

Luka Rajcevic

## Returns

1 if row is found, 0 otherwise

## **Parameters**

num	- 0 based index of row
tbl	- name of the table

# 7.17.2.13 insert\_data\_test()

Function for inserting test data into the table (needed for python testing)

Author

Luka Rajcevic

## **Parameters**

tbl_name	- name of the table for which the header will be created
attr_name	- array of attribute names
attr_value	- values of attributes to be inserted
_num	- number of attributes
_type	- array of attribute types (eg. TYPE_INT, TYPE_VARCHAR, etc.)

### Returns

EXIT\_SUCCESS if ok, EXIT\_ERROR otherwise

# 7.17.2.14 selection\_test()

Function for selection operator on one table.

### Author

Luka Rajcevic

•

### **Parameters**

src_table	- name of the source table
	•
dest_table	- table in which selection will be stored
sel_query	- array of operators, operands and attributes (postfix query)
_num	- number of attributes
_type	- array of attribute types (eg. TYPE_INT, TYPE_VARCHAR, etc.)

## Returns

EXIT\_SUCCESS if ok, EXIT\_ERROR otherwise

# 7.18 auxi/test.h File Reference

```
#include <stdio.h>
#include <unistd.h>
```

Include dependency graph for test.h: This graph shows which files directly or indirectly include this file:

## Classes

struct TestResult

Used so tests can report the amount of successful tests.

## **Macros**

- #define RESET "\033[0m"
- #define BLACK "\033[30m" /\* Black \*/

- #define BOLDCYAN "\033[1m\033[36m" /\* Bold Cyan \*/
- #define BOLDWHITE "\033[1m\033[37m" /\* Bold White \*/

# **Typedefs**

typedef struct TestResult TestResult

## **Functions**

TestResult TEST\_result (int successfulAmount, int failedAmount)

Returns the amount of successful and failed tests.

• void TEST\_output\_results (TestResult result)

Prints a beautiful string informing the user of test results in the terminal.

# 7.18.1 Macro Definition Documentation

## 7.18.1.1 BLACK

```
#define BLACK "\033[30m" /* Black */
```

## 7.18.1.2 BLUE

```
#define BLUE "\033[34m" /* Blue */
```

# 7.18.1.3 **BOLDBLACK**

```
#define BOLDBLACK "\033[1m\033[30m"] /* Bold Black */
```

### 7.18.1.4 BOLDBLUE

```
#define BOLDBLUE "\033[1m\033[34m" /* Bold Blue */
```

# 7.18.1.5 BOLDCYAN

```
#define BOLDCYAN "\033[1m\033[36m" /* Bold Cyan */
```

### **7.18.1.6 BOLDGREEN**

```
#define BOLDGREEN "\033[1m\033[32m" /* Bold Green */
```

# 7.18.1.7 BOLDMAGENTA

```
#define BOLDMAGENTA "\033[1m\033[35m" /* Bold Magenta */
```

## 7.18.1.8 BOLDRED

```
#define BOLDRED "\033[1m\033[31m" /* Bold Red */
```

# 7.18.1.9 **BOLDWHITE**

```
#define BOLDWHITE "\033[1m\033[37m" /* Bold White */
```

## 7.18.1.10 BOLDYELLOW

```
#define BOLDYELLOW "033[1m\\033[33m" /* Bold Yellow */
```

# 7.18.1.11 CYAN

```
#define CYAN "\033[36m" /* Cyan */
```

# 7.18.1.12 GREEN

```
#define GREEN "\033[32m" /* Green */
```

### 7.18.1.13 MAGENTA

```
#define MAGENTA "\033[35m" /* Magenta */
```

# 7.18.1.14 RED

```
#define RED "\033[31m" /* Red */
```

# 7.18.1.15 RESET

```
#define RESET "\033[0m"
```

Provides services for reporting test results.

## 7.18.1.16 WHITE

```
#define WHITE "\033[37m" /* White */
```

# 7.18.1.17 YELLOW

```
#define YELLOW "\033[33m" /* Yellow */
```

# 7.18.2 Typedef Documentation

# 7.18.2.1 TestResult

```
typedef struct TestResult TestResult
```

# 7.18.3 Function Documentation

# 7.18.3.1 TEST\_output\_results()

Prints a beautiful string informing the user of test results in the terminal.

Author

Igor Rinkovec

Returns

void

# 7.18.3.2 TEST\_result()

Returns the amount of successful and failed tests.

Author

Igor Rinkovec

## **Parameters**

successfulAmount	amount of successful tests
failedAmount	amount of failed tests

Returns

**TestResult** 

# 7.19 file/test.h File Reference

```
#include "files.h"
#include "../auxi/mempro.h"
```

Include dependency graph for test.h: This graph shows which files directly or indirectly include this file:

### **Functions**

- char \* AK\_get\_table\_atribute\_types (char \*tblName)
  - returns a string containing attribute types for the supplied table name, seperated by ATTR\_DELIMITER
- int create\_header\_test (char \*tbl\_name, char \*\*attr\_name, int \_num, int \*\_type)

Function for creating test table header.

- int insert\_data\_test (char \*tbl\_name, char \*\*attr\_name, char \*\*attr\_value, int \_num, int \*\_type)

  Function for inserting test data into the table (needed for python testing)
- int selection\_test (char \*src\_table, char \*dest\_table, char \*\*sel\_query, int \_num, int \*\_type)

  Function for selection operator on one table.
- int get\_column\_test (int num, char \*tbl)
  - Function that prints the requested column.
- int get\_row\_test (int num, char \*tbl)

Function that prints the requested row.

• void AK\_create\_test\_tables ()

Function for creating test tables.

# 7.19.1 Detailed Description

Header file that provides functions and defines for testing purposes

## 7.19.2 Function Documentation

## 7.19.2.1 AK\_create\_test\_tables()

```
void AK_create_test_tables ( )
```

Function for creating test tables.

Author

Dino Laktašić

Returns

No return value

Function for creating test tables.

**Author** 

Dino Laktašić edited by Žan Žlender @2022

Returns

No return value

# 7.19.2.2 AK\_get\_table\_atribute\_types()

returns a string containing attribute types for the supplied table name, seperated by ATTR\_DELIMITER

Author

Goran Štrok

**Parameters** 

tblName | name of the table for which the attribute types will be returned

# 7.19.2.3 create\_header\_test()

Function for creating test table header.

Author

Luka Rajcevic

## **Parameters**

tbl_name	- name of the table for which the header will be created
attr_name	- array of attribute names
_num	- number of attributes
_type	- array of attribute types (eg. TYPE_INT, TYPE_VARCHAR, etc.)

## Returns

1 if ok, 0 otherwise

# 7.19.2.4 get\_column\_test()

Function that prints the requested column.

### **Author**

Luka Rajcevic

# Returns

1 if column is found, 0 otherwise

## **Parameters**

num	- 0 based index of column
tbl	- name of the table

# 7.19.2.5 get\_row\_test()

Function that prints the requested row.

## Author

Luka Rajcevic

## Returns

1 if row is found, 0 otherwise

### **Parameters**

num	- 0 based index of row
tbl	- name of the table

# 7.19.2.6 insert\_data\_test()

Function for inserting test data into the table (needed for python testing)

Author

Luka Rajcevic

### **Parameters**

tbl_name	- name of the table for which the header will be created
attr_name	- array of attribute names
attr_value	- values of attributes to be inserted
_num	- number of attributes
_type	- array of attribute types (eg. TYPE_INT, TYPE_VARCHAR, etc.)

### Returns

EXIT\_SUCCESS if ok, EXIT\_ERROR otherwise

# 7.19.2.7 selection\_test()

Function for selection operator on one table.

**Author** 

Luka Rajcevic

.

#### **Parameters**

src_table	- name of the source table
	•
dest_table	- table in which selection will be stored
sel_query	- array of operators, operands and attributes (postfix query)
_num	- number of attributes
_type	- array of attribute types (eg. TYPE_INT, TYPE_VARCHAR, etc.)

### Returns

EXIT SUCCESS if ok, EXIT ERROR otherwise

## 7.20 dm/dbman.c File Reference

```
#include "dbman.h"
#include "../mm/memoman.h"
Include dependency graph for dbman.c:
```

### **Functions**

• int AK init db file (int size)

Function that initializes a new database file named DB\_FILE. It opens database file. New block is allocated. In this block type of header is set to FREE\_INT, attribute names are set to FREE\_CHAR, integrities are set to FREE\_INT, constraint names are set to FREE\_CHAR, constraint names and codes are set to FREE\_CHAR. Type, address and size of tuples are set to FREE\_INT. Data in block is set to FREE\_CHAR. Type of block is BLOCK\_TYPE\_FREE, it is not chained and id of last tuple is 0.

 int AK\_get\_allocation\_set (int \*allocationSet, int fromWhere, int gaplength, int numRequestedBlocks, AK\_allocation\_set\_mode mode, int target)

Function prepare demanded sets from allocation table.

• int AK\_allocationtable\_dump (int verbosity)

Dumps the allocation table from the global allocation bit-vector onto standard output.

void AK\_blocktable\_dump (int verbosity)

Dumps the bit-table from the global allocation bit-vector onto standard output.

• int AK\_blocktable\_flush ()

Function flushes bitmask table to the disk.

void AK\_allocate\_block\_activity\_modes ()

Allocation of an array which will contain information about which blocks are being accessed. Creates an array. Each element of this array will correspond to one initialized block. For more info, see explanation in dbman.h.

• int AK\_blocktable\_get ()

Function gets allocation table from the disk.

int fsize (FILE \*fp)

Helper function to determine file size.

• int AK\_init\_allocation\_table ()

Function that initializes the allocation table, writes it to the disk and caches it in memory.

AK block \* AK init block ()

Function that initializes new block.

int AK\_print\_block (AK\_block \*block, int num, char \*gg, FILE \*fpp)

Function that dumps a block.

int AK allocate blocks (FILE \*db, AK block \*block, int FromWhere, int HowMany)

Function that allocates new blocks by placing them to appropriate place and then updates the last initialized index.

AK block \* AK read block (int address)

Function that reads a block at a given address (block number less than db\_file\_size). New block is allocated. Database file is opened. Position is set to provided address block. At the end function reads file from that position. Completely thread-safe.

int AK write block (AK block \*block)

Function that writes a block to the DB file. Database file is opened. Position is set to provided address block. Block is written to provided address. Completely thread-safe.

int AK\_copy\_header (AK\_header \*header, int \*blockSet, int blockSetSize)

Function copy header to blocks. Completely thread-safe.

• int \* AK\_get\_extent (int start\_address, int desired\_size, AK\_allocation\_set\_mode \*mode, int border, int target, AK\_header \*header, int gl)

Function that allocates new extent of blocks. Number of blocks is not ordered as well as a way of search for them.

• int \* AK\_increase\_extent (int start\_address, int add\_size, AK\_allocation\_set\_mode \*mode, int border, int target, AK header \*header, int gl)

Function that allocates a new blocks for increasing extent size.

• int AK\_new\_extent (int start\_address, int old\_size, int extent\_type, AK\_header \*header)

Function that allocates new extent of blocks. If argument "old\_size" is 0 than size of extent is INITIAL\_EXTENT\_← SIZE. Otherwise, resize factor is set according to type of extent. If writing of block is successful, number of blocks is incremented.

int AK new segment (char \*name, int type, AK header \*header)

Function that allocates new segment of extents. In this phase of implementation, only extents containing INITIAL\_E XTENT\_SIZE blocks can be allocated. If extent is successfully allocated, number of allocated extents is incremented and function goes to next block after allocated extent. Otherwise, function moves to INITIAL\_EXTENT\_SIZE blocks. In that way function gets either first block of new extent or some block in that extent which will not be AK\_free.

AK\_header \* AK\_create\_header (char \*attribute\_name, int type, int integrity, char \*constr\_name, char \*contr\_code)

Function that creates header and initalize integrity, constraint name and constraint code with parameter values of function.

void AK\_insert\_entry (AK\_block \*block\_address, int type, void \*entry\_data, int i)

Function that inserts an entry in tuple\_dict and data of a block. Address, type and size of catalog\_tuple\_dict are set. Free space of block is also set.

• int AK\_init\_system\_tables\_catalog (int relation, int attribute, int index, int view, int sequence, int function, int function\_arguments, int trigger\_conditions, int db, int db\_obj, int user, int group, int user\_group, int user\_right, int group\_right, int constraint, int constraintNull, int constraintCheck, int constraintUnique, int reference)

Function that initialises the sytem table catalog and writes the result in first (0) block in db\_file. Catalog block, catalog header name, catalog header address are allocated. Address, type, chained\_with and AK\_free\_space attributes are initialized. Names of various database elements are written in block.

void AK memset int (void \*block, int value, size t num)

Function that sets the first num ints of a block of memory to the specified value.

• int AK\_register\_system\_tables (int relation, int attribute, int index, int view, int sequence, int function, int function\_arguments, int trigger\_conditions, int db, int db\_obj, int user, int group, int user\_group, int user\_right, int group\_right, int constraint, int constraintNull, int constraintCheck, int constraintUnique, int reference)

Function that registers system tables. Block at the given address is read. Various data from function arguments are written in block about different database elements.

int AK\_init\_system\_catalog ()

Function that initializes the system catalog. Headers for system tables are defined. Segments for those system tables are allocated. Above function AK\_register\_system\_tables() to register system tables.

• int AK delete block (int address)

Function that deletes a block by a given block address (resets the header and data). Types, integrities, constraint names, constraint codes are set to "AK\_free" values. In tuple dictionary type, address and size are set to FREE\_INT values. Data of block is set to FREE\_CHAR.

int AK\_delete\_extent (int begin, int end)

Function that deletes an extent between the first and the last block.

- int AK delete segment (char \*name, int type)
- int AK init disk manager ()
- TestResult AK\_allocationbit\_test ()
- TestResult AK\_allocationtable\_test ()
- TestResult AK thread safe block access test ()

This function tests thread safe reading and writing to blocks. There is N writing and N reading threads, which are going through iterations. Each reading thread should read the data (character) that was set by last writing thread.

void \* AK\_read\_block\_for\_testing (void \*address)

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_read\_block is no-go for pthread\_create.

void \* AK\_write\_block\_for\_testing (void \*block)

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_write\_block is no-go for pthread\_create.

### **Variables**

- pthread mutex t fileLockMutex = PTHREAD MUTEX INITIALIZER
- char test\_lastCharacterWritten = '\0'

This variable is used only when TEST\_MODE is ON! It is used only for testing functionality of AK\_thread\_safe\_block\_access\_test() function. It will contain first character of last written block. When reading thread reads the block (written by some other thread), it will compare the first character from this block to character containted in this wariables. If they don't match, then the error occured! It is assumed that the same block is being written to and read from (just like AK\_thread\_safe\_block\_access\_test function works!)

• int test\_threadSafeBlockAccessSucceeded = 1

Used in combination with test\_lastCharacterWritten. Will give the answer to question: "Has AK\_thread\_safe\_block← \_access\_test suceeded?" 0 means NO, 1 means YES.

# 7.20.1 Detailed Description

Defines functions for the disk manager

### 7.20.2 Function Documentation

### 7.20.2.1 AK allocate block activity modes()

```
void AK_allocate_block_activity_modes ( )
```

Allocation of an array which will contain information about which blocks are being accessed. Creates an array. Each element of this array will correspond to one initialized block. For more info, see explanation in dbman.h.

**Author** 

Domagoj Šitum

# 7.20.2.2 AK\_allocate\_blocks()

```
int AK_allocate_blocks (
    FILE * db,
    AK_block * block,
    int FromWhere,
    int HowMany )
```

Function that allocates new blocks by placing them to appropriate place and then updates the last initialized index.

Author

Markus Schatten, rearranged by dv

Returns

EXIT\_SUCCESS if the file has been written to disk, EXIT\_ERROR otherwise

### 7.20.2.3 AK allocationbit test()

```
TestResult AK_allocationbit_test ( )
```

# 7.20.2.4 AK\_allocationtable\_dump()

Dumps the allocation table from the global allocation bit-vector onto standard output.

Author

dν

# **Parameters**

```
verbosity level of verbosity (1 - minimal, 0 - no output)
```

# 7.20.2.5 AK\_allocationtable\_test()

```
TestResult AK_allocationtable_test ( )
```

# 7.20.2.6 AK\_blocktable\_dump()

Dumps the bit-table from the global allocation bit-vector onto standard output.

**Author** 

dν

### **Parameters**

```
verbosity level of verbosity (1 - verbose, 0 - minimal)
```

# 7.20.2.7 AK\_blocktable\_flush()

```
int AK_blocktable_flush ( )
```

Function flushes bitmask table to the disk.

**Author** 

dν

Returns

EXIT\_SUCCESS if the file has been written to the disk, EXIT\_ERROR otherwise

## 7.20.2.8 AK\_blocktable\_get()

```
int AK_blocktable_get ( )
```

Function gets allocation table from the disk.

Author

dν

Returns

EXIT\_SUCCESS if the file has been taken from disk, EXIT\_ERROR otherwise

# 7.20.2.9 AK\_copy\_header()

Function copy header to blocks. Completely thread-safe.

### **Author**

Nikola Bakoš, updated by Dino Laktašić (fixed header BUG), refurbished by dv, updated by Josip Šušnjara (chained blocks support)

### **Parameters**

header	Pointer to header which will be copied into each block in blockSet
blockSet	Pointer to array of block addresses into which to copy header
blockSetSize	Number of blocks in blockSet

### Returns

number of performed header copy

## 7.20.2.10 AK\_create\_header()

Function that creates header and initalize integrity, constraint name and constraint code with parameter values of function.

## **Author**

Matija Novak

## **Parameters**

name	name of the atribute
type	type of the atribute
integrity	standard integrity costraint
constr_name	extra integrity constraint name
contr code	extra integrity costraint code

### Returns

AK\_header

# 7.20.2.11 AK\_delete\_block()

Function that deletes a block by a given block address (resets the header and data). Types, integrities, constraint names, constraint codes are set to "AK\_free" values. In tuple dictionary type, address and size are set to FREE\_INT values. Data of block is set to FREE\_CHAR.

### **Author**

Markus Schatten

### **Parameters**

Γ	address	address of the block to be deleted

## Returns

returns EXIT\_SUCCESS if deletion successful, else EXIT\_ERROR

# 7.20.2.12 AK\_delete\_extent()

Function that deletes an extent between the first and the last block.

# Author

Dejan Sambolić

### **Parameters**

begin	address of extent's first block
end	address of extent's last block

## Returns

EXIT\_SUCCESS if extent has been successfully deleted, EXIT\_ERROR otherwise

# 7.20.2.13 AK\_delete\_segment()

## **Author**

Mislav Èakariæ, fixed by Josip Susnjara

## **Parameters**

name	name of the segment
type	type of the segment

### Returns

EXIT\_SUCCESS if extent has been successfully deleted, EXIT\_ERROR otherwise

# 7.20.2.14 AK\_get\_allocation\_set()

```
int AK_get_allocation_set (
    int * allocationSet,
    int fromWhere,
    int gaplength,
    int numRequestedBlocks,
    AK_allocation_set_mode mode,
    int target )
```

Function prepare demanded sets from allocation table.

# Author

dν

## **Parameters**

allocationSet	Pointer to array which will be filled and represent the allocation set
fromWhere	Has meaning only if mode is SEQUENCE. It describes from which address searching
	starts.
gaplength	Tells how many used blocks can be tolerated in allocation set
numRequestedBlocks	Tells how many AK_free blocks have been requested
mode	Defines how to obtain set of indexes to AK_free addresses
target	Has meaning just if mode is AROUND: set will be as close as possible to the requested target address from both sides

### Returns

the first element of the allocation set

# 7.20.2.15 AK\_get\_extent()

Function that allocates new extent of blocks. Number of blocks is not ordered as well as a way of search for them.

### **Author**

dν

## **Parameters**

start_address	address (block number) to start searching for sufficient space
desired_size	number of desired blocks
AK_allocation_set_mode	a way of trying to fing AK_free space. Can be one of: allocationSEQUENCE, allocationUPPER, allocationLOWER, allocationAROUND
border	number of allocated blocks gap
target	block address around which other blocks have to be searched
header	pointer to header that should be written to the new extent (all blocks)
int	gl gap size

## Returns

pointer to set of alocated block addresses

vars for loop [for]

if some blocks are not succesfully allocated, which means that the extend allocation has FAILED

# 7.20.2.16 AK\_increase\_extent()

Function that allocates a new blocks for increasing extent size.

### Author

dν

### **Parameters**

start_address	first address of extent that is subject of increasing
add_size	number how many new blocks is to be added to existing extent
AK_allocation_set_mode	a way of trying to fing AK_free space. Can be one of: allocationSEQUENCE, allocationUPPER, allocationLOWER, allocationAROUND
border	number of allocated blocks gap
target	block address around which other blocks have to be searched
header	pointer to header that should be written to the new extent (all blocks)
int	gl gap size

## Returns

pointer to set of alocated block addresses

## 7.20.2.17 AK\_init\_allocation\_table()

```
int AK_init_allocation_table ( )
```

Function that initializes the allocation table, writes it to the disk and caches it in memory.

### **Author**

dv

## Returns

EXIT\_SUCCESS if the file has been written to disk, EXIT\_ERROR otherwise

# 7.20.2.18 AK\_init\_block()

```
AK_block* AK_init_block ( )
```

Function that initializes new block.

### Author

Markus Schatten, rearranged by dv

## Returns

pointer to block allocated in memory

## 7.20.2.19 AK\_init\_db\_file()

Function that initializes a new database file named DB\_FILE. It opens database file. New block is allocated. In this block type of header is set to FREE\_INT, attribute names are set to FREE\_CHAR, integrities are set to FREE\_INT, constraint names are set to FREE\_CHAR. Type, address and size of tuples are set to FREE\_INT. Data in block is set to FREE\_CHAR. Type of block is BLOCK\_TYPE\_FREE, it is not chained and id of last tuple is 0.

### **Author**

Markus Schatten

#### **Parameters**

size	size of new file in in blocks
------	-------------------------------

### Returns

EXIT SUCCESS if the file has been written to disk, EXIT ERROR otherwise

### 7.20.2.20 AK\_init\_disk\_manager()

```
int AK_init_disk_manager ( )
```

## **Author**

Markus Schatten

### Returns

Function that calls functions AK\_init\_db\_file() and AK\_init\_system\_catalog() to initialize disk manager. It also calls AK\_allocate\_array\_currently\_accessed\_blocks() to allocate memory needed for thread-safe reading and writing to disk.

## 7.20.2.21 AK\_init\_system\_catalog()

```
int AK_init_system_catalog ( )
```

Function that initializes the system catalog. Headers for system tables are defined. Segments for those system tables are allocated. Above function AK\_register\_system\_tables() to register system tables.

## **Author**

Miroslav Policki

### Returns

EXIT\_SUCCESS if the system catalog has been successfully initialized, EXIT\_ERROR otherwise

## 7.20.2.22 AK\_init\_system\_tables\_catalog()

```
int AK_init_system_tables_catalog (
             int relation,
             int attribute,
             int index,
             int view,
             int sequence,
             int function,
             int function_arguments,
             int trigger,
             int trigger_conditions,
             int db,
             int db_obj,
             int user,
             int group,
             int user_group,
             int user_right,
             int group_right,
             int constraint,
             int constraintNull,
             int constraintCheck,
             int constraintUnique,
             int reference )
```

Function that initialises the sytem table catalog and writes the result in first (0) block in db\_file. Catalog block, catalog header name, catalog header address are allocated. Address, type, chained\_with and AK\_free\_space attributes are initialized. Names of various database elements are written in block.

# Author

Matija Novak

### **Parameters**

relation	address of system table of relation in db_file
attribute	address of system table of attribute in db_file
index	address of system table of index in db_file
view	address of system table of view in db_file
sequence	address of system table of sequence in db_file
function	address of system table of function in db_file
function_arguments	address of system table of function_arguments in db_file
trigger	address of system table of trigger in db_file
trigger_conditions	address of system table of trigger_conditions in db_file
db	address of system table of db in db_file
db_obj	address of system table of db_obj in db_file
user	address of system table of user in db_file
group	address of system table of group in db_file
user_group	address of system table of users associated with groups in db_file
user_right	address of system table of user right in db_file
group_right	address of system table of group right in db_file
constraint	address of system table of constraint in db_file
constraintNull	address of system table of constraintNull in db_file
constraintCheck	system table address for check constraint
reference	address of system table of reference in db_file
	•

### Returns

EXIT\_SUCCESS if initialization was succesful if not returns EXIT\_ERROR

first header attribute of catalog\_block

second attribute of catalog\_block

initialize other elements of block (adress, type, chained\_with, AK\_free\_space)

using as an address for the first AK\_free space in block->data

merge catalog\_heder with heders created before

### 7.20.2.23 **AK\_insert\_entry()**

Function that inserts an entry in tuple\_dict and data of a block. Address, type and size of catalog\_tuple\_dict are set. Free space of block is also set.

### **Author**

Matija Novak

## **Parameters**

block_adress	adress of a block in which we want insert data
type	type of entry_data
entry_data	(char) data which is inserted, can be int but must first be converted to char
i	(int) adress in tuple_dict array (example block_address->tuple_dict[i])

## Returns

No return value because it gets the address of an block like a function parameter and works directly with the orginal block

copy data into bloc->data on start position bloc->AK\_free\_space

address of entry data in block->data

calculate next AK\_free space for the next entry data

sizeof(entry\_data)+1);///(sizeof(int)); no need for "+strlen(entry\_data)" while "+1" is like "new line"

type of entry data

size of entry data

copy tuple\_dict to block->tuple\_dict[i] must use & becouse tuple\_dict[i] is value and catalog\_tuple\_dict adress

# 7.20.2.24 AK\_memset\_int()

```
void AK_memset_int (
     void * block,
     int value,
     size_t num )
```

Function that sets the first num ints of a block of memory to the specified value.

### **Author**

Miroslav Policki

### **Parameters**

block	pointer to the block of memory to fill
value	int value to be set
num	number of ints in the block of memory to be set

### Returns

No return value

## 7.20.2.25 AK\_new\_extent()

Function that allocates new extent of blocks. If argument "old\_size" is 0 than size of extent is INITIAL\_EXTENT\_

SIZE. Otherwise, resize factor is set according to type of extent. If writing of block is successful, number of blocks is incremented.

## **Author**

Nikola Bakoš, updated by Dino Laktašiæ (fixed header BUG), refurbished by dv

# **Parameters**

start_address	address (block number) to start searching for sufficient space	
old_size	size of previous extent in same segment (in blocks)	
extent_type	type of extent (can be one of: SEGMENT_TYPE_SYSTEM_TABLE, SEGMENT_TYPE_TABLE, SEGMENT_TYPE_INDEX, SEGMENT_TYPE_TEMP	
header	pointer to header that should be written to the new extent (all blocks)	

### Returns

address (block number) of new extent if successful, EXIT\_ERROR otherwise

## 7.20.2.26 AK\_new\_segment()

Function that allocates new segment of extents. In this phase of implementation, only extents containing INI← TIAL\_EXTENT\_SIZE blocks can be allocated. If extent is successfully allocated, number of allocated extents is incremented and function goes to next block after allocated extent. Otherwise, function moves to INITIAL\_EXTE← NT\_SIZE blocks. In that way function gets either first block of new extent or some block in that extent which will not be AK\_free.

### **Author**

Tomislav Fotak, refurbished by dv

### **Parameters**

name	(character pointer) name of segment	
type	segment type (possible values: SEGMENT_TYPE_SYSTEM_TABLE, SEGMENT_TYPE_TABLE, SEGMENT_TYPE_INDEX, SEGMENT_TYPE_TRANSACTION, SEGMENT_TYPE_TEMP)	
header	(header pointer) pointer to header that should be written to the new extent (all blocks)	

## Returns

EXIT\_SUCCESS for success or EXIT\_ERROR if some error occurs

start address for segment because we can not allocate segment in block 0

# 7.20.2.27 AK\_print\_block()

Function that dumps a block.

Author

dν

Returns

nothing

## 7.20.2.28 AK\_read\_block()

Function that reads a block at a given address (block number less than db\_file\_size). New block is allocated. Database file is opened. Position is set to provided address block. At the end function reads file from that position. Completely thread-safe.

**Author** 

Markus Schatten, updated by dv and Domagoj Šitum (thread-safe enabled)

### **Parameters**

address	block number (address)
---------	------------------------

### Returns

pointer to block allocated in memory

## 7.20.2.29 AK\_read\_block\_for\_testing()

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_read\_block is no-go for pthread\_create.

# Author

Domagoj Šitum

## 7.20.2.30 AK\_register\_system\_tables()

```
int AK_register_system_tables (
    int relation,
    int attribute,
    int index,
    int view,
    int sequence,
    int function,
    int function_arguments,
    int trigger,
    int trigger_conditions,
    int db,
```

```
int db_obj,
int user,
int group,
int user_group,
int user_right,
int group_right,
int constraint,
int constraintNull,
int constraintCheck,
int constraintUnique,
int reference )
```

Function that registers system tables. Block at the given address is read. Various data from function arguments are written in block about different database elements.

#### **Author**

Unknown

#### **Parameters**

relation	relation in database
attribute	attribute in databse
index	index in database
view	view in database
sequence	sequence in database
function	function in database
function_arguments	functional_arguments in databse
trigger	trigger in database
trigger_conditions	trigger conditions in databse
db	database
db_obj	database object
user	user in database
group	group in database
user_group	user associated with group in database
user_right	user right in database
group_right	group right in database
constraint	constraint in database
constraintNull	Null constraint in database
constraintCheck	Check constraint in database
reference	reference database

## Returns

EXIT\_SUCCESS

### 7.20.2.31 AK\_thread\_safe\_block\_access\_test()

```
TestResult AK_thread_safe_block_access_test ( )
```

This function tests thread safe reading and writing to blocks. There is N writing and N reading threads, which are going through iterations. Each reading thread should read the data (character) that was set by last writing thread.

#### Author

Domagoj Šitum

### 7.20.2.32 AK\_write\_block()

Function that writes a block to the DB file. Database file is opened. Position is set to provided address block. Block is written to provided address. Completely thread-safe.

Function that writes the new value in block when index is updated.

### Author

Markus Schatten, updated by Domagoj Šitum (thread-safe enabled)

#### **Parameters**

block poiner to block allocated in memory to write

### Returns

EXIT\_SUCCESS if successful, EXIT\_ERROR otherwise

# 7.20.2.33 AK\_write\_block\_for\_testing()

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_write\_block is no-go for pthread\_create.

#### **Author**

Domagoj Šitum

#### 7.20.2.34 fsize()

```
int fsize ( \label{eq:file} {\tt FILE} \, * \, fp \,\,)
```

Helper function to determine file size.

### Returns

file size

#### 7.20.3 Variable Documentation

#### 7.20.3.1 fileLockMutex

```
pthread_mutex_t fileLockMutex = PTHREAD_MUTEX_INITIALIZER
```

### 7.20.3.2 test\_lastCharacterWritten

```
test_lastCharacterWritten = '\0'
```

This variable is used only when TEST\_MODE is ON! It is used only for testing functionality of AK\_thread\_safe\_block\_access\_test() function. It will contain first character of last written block. When reading thread reads the block (written by some other thread), it will compare the first character from this block to character containted in this wariables. If they don't match, then the error occured! It is assumed that the same block is being written to and read from (just like AK\_thread\_safe\_block\_access\_test function works!)

### 7.20.3.3 test\_threadSafeBlockAccessSucceeded

```
test_threadSafeBlockAccessSucceeded = 1
```

Used in combination with test\_lastCharacterWritten. Will give the answer to question: "Has AK\_thread\_safe\_← block\_access\_test suceeded?" 0 means NO, 1 means YES.

# 7.21 dm/dbman.h File Reference

```
#include "../auxi/test.h"

Include dependency graph for dbman.h: This graph shows which files directly or indirectly include this file:

#### **Classes**

· struct AK header

Structure that represents header structure of blocks (describes an attribute inside an object). It contains type, attribute name, integrity, constraint name and constraint code.

struct AK tuple dict

Structure that defines a mapping in a header of an object to the actual entries (data). It contains type, address and size.

struct AK block

Structure that defines a block of data inside a DB file. It contains address, type, chained\_with, AK\_free space, last\_tuple\_dict\_id, header and tuple\_dict and data.

· struct table addresses

Structure that defines start and end address of extent.

- · struct AK blocktable
- struct AK\_block\_activity

Structure which holds information about each block, whether it is locked for reading or writing. It is important to note such information, to enable quick and thread-safe reading from or writing to disk. Structure contains of: locked\_\infty for\_reading - thread which locks particular block for reading will set this value locked\_for\_writing - thread which locks particular block for writing will set this value block\_lock - each reading and writing operation will be done atomically and uninteruptable, using this mutex block lock reading\_done - represents signal, which sends thread that just finished reading block. This signal will indicate that writing thread can start writing to block writing\_done - represents signal, which sends thread that just finished writing to block. This signal will indicate that other threads can start reading from this block or even writing to it thread\_holding\_lock - the only thread which can unlock locked "block\_lock" is the one that locked it. This variable makes sure that ONLY the thread, which actually holds the lock, releases it.

#### **Macros**

- #define BITMASK(b) (1 << ((b) % CHAR\_BIT))</li>
- #define BITSLOT(b) ((int)((b) / CHAR BIT))
- #define BITSET(a, b) ((a)[BITSLOT(b)] |= BITMASK(b))
- #define BITCLEAR(a, b) ((a)[BITSLOT(b)] &= ~BITMASK(b))
- #define BITTEST(a, b) ((a)[BITSLOT(b)] & BITMASK(b))
- #define BITNSLOTS(nb) ((int)(nb + CHAR\_BIT 1) / CHAR\_BIT)
- #define SEGMENTLENGTH() (BITNSLOTS(DB\_FILE\_BLOCKS\_NUM) + 2\*sizeof(int))
- #define DB FILE SIZE EX 200
- #define DB\_FILE\_BLOCKS\_NUM\_EX (int)(1024 \* 1024 \* DB\_FILE\_SIZE\_EX / sizeof(AK\_block))
- #define AK\_ALLOCATION\_TABLE\_SIZE sizeof(AK\_blocktable)

Holds size of allocation table.

• #define CHAR\_IN\_LINE 80

How many characters could line contain.

#define MAX\_BLOCK\_INIT\_NUM MAX\_CACHE\_MEMORY

How many blocks would be initially allocated.

### **Enumerations**

enum AK\_allocation\_set\_mode {
 allocationSEQUENCE = 10001, allocationUPPER, allocationLOWER, allocationAROUND,
 allocationNOMODE }

Different modes to obtain allocation indexes: SEQUENCE - first found set of sequence indexes UPPER - set tries to place itself to upper part od allocation table LOWER - set tries to place itself to lower part od allocation table AROUND - set tries to place itself around targeted index.

#### **Functions**

int AK\_print\_block (AK\_block \*block, int num, char \*gg, FILE \*fpp)

Function that dumps a block.

- TestResult AK allocationbit test ()
- TestResult AK allocationtable test ()
- int \* AK\_increase\_extent (int start\_address, int add\_size, AK\_allocation\_set\_mode \*mode, int border, int target, AK\_header \*header, int gl)

Function that allocates a new blocks for increasing extent size.

int \* AK\_get\_extent (int start\_address, int desired\_size, AK\_allocation\_set\_mode \*mode, int border, int target, AK header \*header, int gl)

Function that allocates new extent of blocks. Number of blocks is not ordered as well as a way of search for them.

• int AK\_get\_allocation\_set (int \*bitsetbs, int fromWhere, int gaplength, int num, AK\_allocation\_set\_mode mode, int target)

Function prepare demanded sets from allocation table.

• int AK\_copy\_header (AK\_header \*header, int \*blocknum, int num)

Function copy header to blocks. Completely thread-safe.

int AK\_allocate\_blocks (FILE \*db, AK\_block \*block, int FromWhere, int HowMany)

Function that allocates new blocks by placing them to appropriate place and then updates the last initialized index.

AK\_block \* AK\_init\_block ()

Function that initializes new block.

int AK\_allocationtable\_dump (int zz)

Dumps the allocation table from the global allocation bit-vector onto standard output.

void AK\_blocktable\_dump (int zz)

Dumps the bit-table from the global allocation bit-vector onto standard output.

int AK\_blocktable\_flush ()

Function flushes bitmask table to the disk.

TestResult AK\_thread\_safe\_block\_access\_test ()

This function tests thread safe reading and writing to blocks. There is N writing and N reading threads, which are going through iterations. Each reading thread should read the data (character) that was set by last writing thread.

void \* AK\_read\_block\_for\_testing (void \*address)

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_read\_block is no-go for pthread\_create.

void \* AK\_write\_block\_for\_testing (void \*block)

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_write\_block is no-go for pthread\_create.

int AK\_blocktable\_get ()

Function gets allocation table from the disk.

• int fsize (FILE \*fp)

Helper function to determine file size.

• int AK\_init\_allocation\_table ()

Function that initializes the allocation table, writes it to the disk and caches it in memory.

int AK\_init\_db\_file (int size)

Function that initializes a new database file named DB\_FILE. It opens database file. New block is allocated. In this block type of header is set to FREE\_INT, attribute names are set to FREE\_CHAR, integrities are set to FREE\_INT, constraint names are set to FREE\_CHAR, constraint names and codes are set to FREE\_CHAR. Type, address and size of tuples are set to FREE\_INT. Data in block is set to FREE\_CHAR. Type of block is BLOCK\_TYPE\_FREE, it is not chained and id of last tuple is 0.

AK block \* AK read block (int address)

Function that reads a block at a given address (block number less than db\_file\_size). New block is allocated. Database file is opened. Position is set to provided address block. At the end function reads file from that position. Completely thread-safe.

int AK\_write\_block (AK\_block \*block)

Function that writes a block to the DB file. Database file is opened. Position is set to provided address block. Block is written to provided address. Completely thread-safe.

int AK\_new\_extent (int start\_address, int old\_size, int extent\_type, AK\_header \*header)

Function that allocates new extent of blocks. If argument "old\_size" is 0 than size of extent is INITIAL\_EXTENT\_← SIZE. Otherwise, resize factor is set according to type of extent. If writing of block is successful, number of blocks is incremented.

• int AK new segment (char \*name, int type, AK header \*header)

Function that allocates new segment of extents. In this phase of implementation, only extents containing INITIAL\_E XTENT\_SIZE blocks can be allocated. If extent is successfully allocated, number of allocated extents is incremented and function goes to next block after allocated extent. Otherwise, function moves to INITIAL\_EXTENT\_SIZE blocks. In that way function gets either first block of new extent or some block in that extent which will not be AK\_free.

AK\_header \* AK\_create\_header (char \*name, int type, int integrity, char \*constr\_name, char \*contr\_code)
 Function that creates header and initalize integrity, constraint name and constraint code with parameter values of function.

• void AK insert entry (AK block \*block address, int type, void \*entry data, int i)

Function that inserts an entry in tuple\_dict and data of a block. Address, type and size of catalog\_tuple\_dict are set. Free space of block is also set.

• int AK\_init\_system\_tables\_catalog (int relation, int attribute, int index, int view, int sequence, int function, int function\_arguments, int trigger\_conditions, int db, int db\_obj, int user, int group, int user\_group, int user\_right, int group\_right, int constraint, int constraintNull, int constraintCheck, int constraintUnique, int reference)

Function that initialises the sytem table catalog and writes the result in first (0) block in db\_file. Catalog block, catalog header name, catalog header address are allocated. Address, type, chained\_with and AK\_free\_space attributes are initialized. Names of various database elements are written in block.

void AK\_memset\_int (void \*block, int value, size\_t num)

Function that sets the first num ints of a block of memory to the specified value.

• int AK\_register\_system\_tables (int relation, int attribute, int index, int view, int sequence, int function, int function\_arguments, int trigger\_conditions, int db, int db\_obj, int user, int group, int user\_group, int user\_right, int group\_right, int constraint, int constraintNull, int constraintCheck, int constraintUnique, int reference)

Function that registers system tables. Block at the given address is read. Various data from function arguments are written in block about different database elements.

int AK init system catalog ()

Function that initializes the system catalog. Headers for system tables are defined. Segments for those system tables are allocated. Above function AK\_register\_system\_tables() to register system tables.

int AK\_delete\_block (int address)

Function that deletes a block by a given block address (resets the header and data). Types, integrities, constraint names, constraint codes are set to "AK\_free" values. In tuple dictionary type, address and size are set to FREE\_INT values. Data of block is set to FREE\_CHAR.

int AK\_delete\_extent (int begin, int end)

Function that deletes an extent between the first and the last block.

- int AK\_delete\_segment (char \*name, int type)
- int AK init disk manager ()

## **Variables**

· PtrContainer db

Variable that defines the DB file file handle.

• unsigned int db\_file\_size

Variable that defines the size of the DB file (in blocks)

· PtrContainer AK allocationbit

Global variable that holds allocation bit-vector.

- · PtrContainer AK block activity info
- · PtrContainer dbmanFileLock

# 7.21.1 Detailed Description

Header file that contains all defines, includes and data structures for the disk manager of Kalashnikov DB

### 7.21.2 Macro Definition Documentation

### 7.21.2.1 AK\_ALLOCATION\_TABLE\_SIZE

```
#define AK_ALLOCATION_TABLE_SIZE sizeof(AK_blocktable)
```

Holds size of allocation table.

**Author** 

dν

## 7.21.2.2 BITCLEAR

# 7.21.2.3 BITMASK

```
#define BITMASK( b \ ) \ (1 << \ ((b) \ % \ CHAR\_BIT))
```

# 7.21.2.4 BITNSLOTS

### 7.21.2.5 BITSET

## 7.21.2.6 BITSLOT

## 7.21.2.7 BITTEST

## 7.21.2.8 CHAR\_IN\_LINE

```
#define CHAR_IN_LINE 80
```

How many characters could line contain.

Author

dν

## 7.21.2.9 DB\_FILE\_BLOCKS\_NUM\_EX

```
#define DB_FILE_BLOCKS_NUM_EX (int)(1024 * 1024 * DB_FILE_SIZE_EX / sizeof(AK_block))
```

## 7.21.2.10 DB\_FILE\_SIZE\_EX

```
#define DB_FILE_SIZE_EX 200
```

## 7.21.2.11 MAX\_BLOCK\_INIT\_NUM

```
#define MAX_BLOCK_INIT_NUM MAX_CACHE_MEMORY
```

How many blocks would be initially allocated.

Author

dv

#### 7.21.2.12 SEGMENTLENGTH

```
#define SEGMENTLENGTH() (BITNSLOTS(DB_FILE_BLOCKS_NUM) + 2*sizeof(int))
```

# 7.21.3 Enumeration Type Documentation

### 7.21.3.1 AK\_allocation\_set\_mode

```
enum AK_allocation_set_mode
```

Different modes to obtain allocation indexes: SEQUENCE - first found set of sequence indexes UPPER - set tries to place itself to upper part od allocation table LOWER - set tries to place itself to lower part od allocation table AROUND - set tries to place itself around targeted index.

**Author** 

dν

#### **Enumerator**

allocationSEQUENCE	
allocationUPPER	
allocationLOWER	
allocationAROUND	
allocationNOMODE	

## 7.21.4 Function Documentation

## 7.21.4.1 AK\_allocate\_blocks()

```
int AK_allocate_blocks (
    FILE * db,
    AK_block * block,
    int FromWhere,
    int HowMany )
```

Function that allocates new blocks by placing them to appropriate place and then updates the last initialized index.

**Author** 

Markus Schatten, rearranged by dv

Returns

EXIT\_SUCCESS if the file has been written to disk, EXIT\_ERROR otherwise

## 7.21.4.2 AK\_allocationbit\_test()

```
TestResult AK_allocationbit_test ( )
```

## 7.21.4.3 AK\_allocationtable\_dump()

Dumps the allocation table from the global allocation bit-vector onto standard output.

Author

dν

### **Parameters**

```
verbosity | level of verbosity (1 - minimal, 0 - no output)
```

## 7.21.4.4 AK\_allocationtable\_test()

```
TestResult AK_allocationtable_test ( )
```

# 7.21.4.5 AK\_blocktable\_dump()

Dumps the bit-table from the global allocation bit-vector onto standard output.

Author

dν

## **Parameters**

verbosity	level of verbosity	(1 - verbose, 0 - minimal	)

# 7.21.4.6 AK\_blocktable\_flush()

```
int AK_blocktable_flush ( )
```

Function flushes bitmask table to the disk.

**Author** 

dν

#### Returns

EXIT\_SUCCESS if the file has been written to the disk, EXIT\_ERROR otherwise

## 7.21.4.7 AK\_blocktable\_get()

```
int AK_blocktable_get ( )
```

Function gets allocation table from the disk.

**Author** 

dν

## Returns

EXIT\_SUCCESS if the file has been taken from disk, EXIT\_ERROR otherwise

### 7.21.4.8 AK\_copy\_header()

Function copy header to blocks. Completely thread-safe.

# Author

Nikola Bakoš, updated by Dino Laktašić (fixed header BUG), refurbished by dv, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

header	Pointer to header which will be copied into each block in blockSet	
blockSet	Pointer to array of block addresses into which to copy header	
generales et Sizge	n Number of blocks in blockSet	

#### Returns

number of performed header copy

## 7.21.4.9 AK\_create\_header()

Function that creates header and initalize integrity, constraint name and constraint code with parameter values of function.

#### **Author**

Matija Novak

#### **Parameters**

name	name of the atribute
type	type of the atribute
integrity	standard integrity costraint
constr_name	extra integrity constraint name
contr_code	extra integrity costraint code

### Returns

AK\_header

## 7.21.4.10 AK\_delete\_block()

Function that deletes a block by a given block address (resets the header and data). Types, integrities, constraint names, constraint codes are set to "AK\_free" values. In tuple dictionary type, address and size are set to FREE\_INT values. Data of block is set to FREE\_CHAR.

#### **Author**

Markus Schatten

#### **Parameters**

address	address of the block to be deleted

## Returns

returns EXIT\_SUCCESS if deletion successful, else EXIT\_ERROR

## 7.21.4.11 AK\_delete\_extent()

Function that deletes an extent between the first and the last block.

#### **Author**

Dejan Sambolić

#### **Parameters**

begin	address of extent's first block
end	address of extent's last block

## Returns

EXIT\_SUCCESS if extent has been successfully deleted, EXIT\_ERROR otherwise

## 7.21.4.12 AK\_delete\_segment()

## Author

Mislav Èakariæ, fixed by Josip Susnjara

#### **Parameters**

name	name of the segment
type	type of the segment

#### Returns

EXIT\_SUCCESS if extent has been successfully deleted, EXIT\_ERROR otherwise

## 7.21.4.13 AK\_get\_allocation\_set()

Function prepare demanded sets from allocation table.

**Author** 

dν

#### **Parameters**

allocationSet	Pointer to array which will be filled and represent the allocation set
fromWhere	Has meaning only if mode is SEQUENCE. It describes from which address searching
	starts.
gaplength	Tells how many used blocks can be tolerated in allocation set
numRequestedBlocks	Tells how many AK_free blocks have been requested
mode	Defines how to obtain set of indexes to AK_free addresses
target	Has meaning just if mode is AROUND: set will be as close as possible to the requested target address from both sides

### Returns

the first element of the allocation set

# 7.21.4.14 AK\_get\_extent()

Function that allocates new extent of blocks. Number of blocks is not ordered as well as a way of search for them.

### **Author**

dν

#### **Parameters**

start_address	address (block number) to start searching for sufficient space
desired_size	number of desired blocks
AK_allocation_set_mode	a way of trying to fing AK_free space. Can be one of: allocationSEQUENCE, allocationUPPER, allocationLOWER, allocationAROUND
border	number of allocated blocks gap
target	block address around which other blocks have to be searched
header	pointer to header that should be written to the new extent (all blocks)
int	gl gap size

## Returns

pointer to set of alocated block addresses

vars for loop [for]

if some blocks are not succesfully allocated, which means that the extend allocation has FAILED

## 7.21.4.15 AK\_increase\_extent()

```
int* AK_increase_extent (
    int start_address,
    int add_size,
    AK_allocation_set_mode * mode,
    int border,
    int target,
    AK_header * header,
    int gl )
```

Function that allocates a new blocks for increasing extent size.

#### Author

dν

#### **Parameters**

start_address	first address of extent that is subject of increasing
add_size	number how many new blocks is to be added to existing extent
AK_allocation_set_mode	a way of trying to fing AK_free space. Can be one of: allocationSEQUENCE, allocationUPPER, allocationLOWER, allocationAROUND
border	number of allocated blocks gap
target	block address around which other blocks have to be searched
header	pointer to header that should be written to the new extent (all blocks)
int	gl gap size

#### Returns

pointer to set of alocated block addresses

#### 7.21.4.16 AK init allocation table()

```
int AK_init_allocation_table ( )
```

Function that initializes the allocation table, writes it to the disk and caches it in memory.

**Author** 

dν

#### Returns

EXIT\_SUCCESS if the file has been written to disk, EXIT\_ERROR otherwise

### 7.21.4.17 AK\_init\_block()

```
AK_block* AK_init_block ( )
```

Function that initializes new block.

Author

Markus Schatten, rearranged by dv

Returns

pointer to block allocated in memory

#### 7.21.4.18 AK\_init\_db\_file()

Function that initializes a new database file named DB\_FILE. It opens database file. New block is allocated. In this block type of header is set to FREE\_INT, attribute names are set to FREE\_CHAR, integrities are set to FREE\_INT, constraint names are set to FREE\_CHAR. Type, address and size of tuples are set to FREE\_INT. Data in block is set to FREE\_CHAR. Type of block is BLOCK\_TYPE\_FREE, it is not chained and id of last tuple is 0.

#### **Author**

Markus Schatten

#### **Parameters**

size | size of new file in in blocks

#### Returns

EXIT\_SUCCESS if the file has been written to disk, EXIT\_ERROR otherwise

## 7.21.4.19 AK\_init\_disk\_manager()

```
int AK_init_disk_manager ( )
```

#### **Author**

Markus Schatten

### Returns

Function that calls functions AK\_init\_db\_file() and AK\_init\_system\_catalog() to initialize disk manager. It also calls AK\_allocate\_array\_currently\_accessed\_blocks() to allocate memory needed for thread-safe reading and writing to disk.

## 7.21.4.20 AK\_init\_system\_catalog()

```
int AK_init_system_catalog ( )
```

Function that initializes the system catalog. Headers for system tables are defined. Segments for those system tables are allocated. Above function AK\_register\_system\_tables() to register system tables.

### Author

Miroslav Policki

## Returns

EXIT\_SUCCESS if the system catalog has been successfully initialized, EXIT\_ERROR otherwise

### 7.21.4.21 AK\_init\_system\_tables\_catalog()

```
int AK_init_system_tables_catalog (
             int relation,
             int attribute,
             int index,
             int view,
             int sequence,
             int function,
             int function_arguments,
             int trigger,
             int trigger_conditions,
             int db,
             int db_obj,
             int user,
             int group,
             int user_group,
             int user_right,
             int group_right,
             int constraint,
             int constraintNull,
             int constraintCheck,
             int constraintUnique,
             int reference )
```

Function that initialises the sytem table catalog and writes the result in first (0) block in db\_file. Catalog block, catalog header name, catalog header address are allocated. Address, type, chained\_with and AK\_free\_space attributes are initialized. Names of various database elements are written in block.

# Author

Matija Novak

#### **Parameters**

relation	address of system table of relation in db_file
attribute	address of system table of attribute in db_file
index	address of system table of index in db_file
view	address of system table of view in db_file
sequence	address of system table of sequence in db_file
function	address of system table of function in db_file
function_arguments	address of system table of function_arguments in db_file
trigger	address of system table of trigger in db_file
trigger_conditions	address of system table of trigger_conditions in db_file
db	address of system table of db in db_file
db_obj	address of system table of db_obj in db_file
user	address of system table of user in db_file
group	address of system table of group in db_file
user_group	address of system table of users associated with groups in db_file
user_right	address of system table of user right in db_file
group_right	address of system table of group right in db_file
constraint	address of system table of constraint in db_file
constraintNull	address of system table of constraintNull in db_file
constraintCheck	system table address for check constraint
reference	address of system table of reference in db_file

#### Returns

EXIT\_SUCCESS if initialization was succesful if not returns EXIT\_ERROR

first header attribute of catalog\_block

second attribute of catalog\_block

initialize other elements of block (adress, type, chained\_with, AK\_free\_space)

using as an address for the first AK\_free space in block->data

merge catalog\_heder with heders created before

#### 7.21.4.22 **AK\_insert\_entry()**

Function that inserts an entry in tuple\_dict and data of a block. Address, type and size of catalog\_tuple\_dict are set. Free space of block is also set.

#### **Author**

Matija Novak

## **Parameters**

block_adress	adress of a block in which we want insert data	
type	type of entry_data	
entry_data	entry_data (char) data which is inserted, can be int but must first be converted to c	
i	(int) adress in tuple_dict array (example block_address->tuple_dict[i])	

## Returns

No return value because it gets the address of an block like a function parameter and works directly with the orginal block

copy data into bloc->data on start position bloc->AK\_free\_space

address of entry data in block->data

calculate next AK\_free space for the next entry data

sizeof(entry\_data)+1);///(sizeof(int)); no need for "+strlen(entry\_data)" while "+1" is like "new line"

type of entry data

size of entry data

copy tuple\_dict to block->tuple\_dict[i] must use & becouse tuple\_dict[i] is value and catalog\_tuple\_dict adress

## 7.21.4.23 AK\_memset\_int()

```
void AK_memset_int (
     void * block,
     int value,
     size_t num )
```

Function that sets the first num ints of a block of memory to the specified value.

#### **Author**

Miroslav Policki

#### **Parameters**

block	pointer to the block of memory to fill	
value	int value to be set	
num	num   number of ints in the block of memory to be se	

#### Returns

No return value

### 7.21.4.24 AK\_new\_extent()

Function that allocates new extent of blocks. If argument "old\_size" is 0 than size of extent is INITIAL\_EXTENT\_

SIZE. Otherwise, resize factor is set according to type of extent. If writing of block is successful, number of blocks is incremented.

### **Author**

Nikola Bakoš, updated by Dino Laktašiæ (fixed header BUG), refurbished by dv

## **Parameters**

start_address	address (block number) to start searching for sufficient space	
old_size	size of previous extent in same segment (in blocks)	
extent_type	type of extent (can be one of: SEGMENT_TYPE_SYSTEM_TABLE, SEGMENT_TYPE_TABLE, SEGMENT_TYPE_INDEX, SEGMENT_TYPE_TEMP	
header	pointer to header that should be written to the new extent (all blocks)	

#### Returns

address (block number) of new extent if successful, EXIT\_ERROR otherwise

## 7.21.4.25 AK\_new\_segment()

Function that allocates new segment of extents. In this phase of implementation, only extents containing  $INI \leftarrow TIAL\_EXTENT\_SIZE$  blocks can be allocated. If extent is successfully allocated, number of allocated extents is incremented and function goes to next block after allocated extent. Otherwise, function moves to  $INITIAL\_EXTE \leftarrow NT\_SIZE$  blocks. In that way function gets either first block of new extent or some block in that extent which will not be  $AK\_free$ .

#### **Author**

Tomislav Fotak, refurbished by dv

#### **Parameters**

name	(character pointer) name of segment
type	segment type (possible values: SEGMENT_TYPE_SYSTEM_TABLE, SEGMENT_TYPE_TABLE, SEGMENT_TYPE_INDEX, SEGMENT_TYPE_TRANSACTION, SEGMENT_TYPE_TEMP)
header	(header pointer) pointer to header that should be written to the new extent (all blocks)

## Returns

EXIT\_SUCCESS for success or EXIT\_ERROR if some error occurs

start address for segment because we can not allocate segment in block 0

## 7.21.4.26 AK\_print\_block()

```
int AK_print_block (
          AK_block * block,
          int num,
          char * gg,
          FILE * fpp )
```

Function that dumps a block.

Author

dν

Returns

nothing

### 7.21.4.27 AK\_read\_block()

Function that reads a block at a given address (block number less than db\_file\_size). New block is allocated. Database file is opened. Position is set to provided address block. At the end function reads file from that position. Completely thread-safe.

**Author** 

Markus Schatten, updated by dv and Domagoj Šitum (thread-safe enabled)

#### **Parameters**

address	block number (address)
---------	------------------------

#### Returns

pointer to block allocated in memory

### 7.21.4.28 AK\_read\_block\_for\_testing()

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_read\_block is no-go for pthread\_create.

# Author

Domagoj Šitum

## 7.21.4.29 AK\_register\_system\_tables()

```
int AK_register_system_tables (
    int relation,
    int attribute,
    int index,
    int view,
    int sequence,
    int function,
    int trigger,
    int trigger_conditions,
    int db,
```

```
int db_obj,
int user,
int group,
int user_group,
int user_right,
int group_right,
int constraint,
int constraintNull,
int constraintCheck,
int constraintUnique,
int reference )
```

Function that registers system tables. Block at the given address is read. Various data from function arguments are written in block about different database elements.

#### **Author**

Unknown

#### **Parameters**

relation	relation in database
attribute	attribute in databse
index	index in database
view	view in database
sequence	sequence in database
function	function in database
function_arguments	functional_arguments in databse
trigger	trigger in database
trigger_conditions	trigger conditions in databse
db	database
db_obj	database object
user	user in database
group	group in database
user_group	user associated with group in database
user_right	user right in database
group_right	group right in database
constraint	constraint in database
constraintNull	Null constraint in database
constraintCheck	Check constraint in database
reference	reference database

## Returns

EXIT\_SUCCESS

### 7.21.4.30 AK\_thread\_safe\_block\_access\_test()

```
TestResult AK_thread_safe_block_access_test ( )
```

This function tests thread safe reading and writing to blocks. There is N writing and N reading threads, which are going through iterations. Each reading thread should read the data (character) that was set by last writing thread.

#### Author

Domagoj Šitum

### 7.21.4.31 AK\_write\_block()

Function that writes a block to the DB file. Database file is opened. Position is set to provided address block. Block is written to provided address. Completely thread-safe.

Author

Markus Schatten, updated by Domagoj Šitum (thread-safe enabled)

#### **Parameters**

block poiner to block allocated in memory to write

#### Returns

EXIT\_SUCCESS if successful, EXIT\_ERROR otherwise

### 7.21.4.32 AK\_write\_block\_for\_testing()

```
void* AK_write_block_for_testing (  {\tt void} \, * \, block \, )
```

This function is only for testing. It has to be there, because pthread\_create only accepts void\* function\_name (void \*) function format. So AK\_write\_block is no-go for pthread\_create.

Author

Domagoj Šitum

### 7.21.4.33 fsize()

```
int fsize ( \label{eq:file} {\tt FILE} \, * \, fp \,\,)
```

Helper function to determine file size.

Returns

file size

# 7.21.5 Variable Documentation

## 7.21.5.1 AK\_allocationbit

AK\_allocationbit

Global variable that holds allocation bit-vector.

Author

dν

# 7.21.5.2 AK\_block\_activity\_info

PtrContainer AK\_block\_activity\_info

# 7.21.5.3 db

db

Variable that defines the DB file file handle.

**Author** 

Markus Schatten

# 7.21.5.4 db\_file\_size

db\_file\_size

Variable that defines the size of the DB file (in blocks)

**Author** 

Markus Schatten

#### 7.21.5.5 dbmanFileLock

PtrContainer dbmanFileLock

## 7.22 file/blobs.c File Reference

```
#include <dirent.h>
#include <stdio.h>
#include <stdlib.h>
#include <sys/stat.h>
#include <sys/types.h>
#include <unistd.h>
#include <errno.h>
#include <fcntl.h>
#include "../auxi/configuration.h"
#include "../dm/dbman.h"
#include "blobs.h"
Include dependency graph for blobs.c:
```

## **Functions**

```
• AK_File_Metadata AK_File_Metadata_malloc ()
```

• char \* AK\_GUID ()

Function that generates GUID.

• int AK\_folder\_exists (char \*foldername)

Function that checks if folder blobs already exists.

• int AK\_mkdir (const char \*path)

Function that creates new folder.

- int AK copy (const char \*from, const char \*to)
- char \* AK\_concat (char \*s1, char \*s2)

Function for AK\_concatinating 2 strings.

- char \* AK\_clear\_all\_newline (char \*s)
- int AK check folder blobs ()

Function that checks if folder blobs exists.

void AK\_split\_path\_file (char \*\*p, char \*\*f, char \*pf)

Function that splits a path from filename.

• int AK\_write\_metadata (char \*oid, AK\_File\_Metadata meta)

Function that opens an existing file in write mode and writes formatted output in it.

AK\_File\_Metadata AK\_read\_metadata (char \*oid)

Opens file based on given object id, copies metadata from it and returns as result.

char \* AK\_lo\_import (char \*filepath)

Function that imports large objects to database.

int AK\_lo\_export (char \*oid, char \*filepath)

Function that retrieves large objects.

int AK\_lo\_unlink (char \*oid)

Function that deletes large objects.

TestResult AK\_lo\_test ()

Tests.

## **Variables**

- int success = 0
- int failed = 0

# 7.22.1 Detailed Description

Provides functions for manipulations of binary large objects

## 7.22.2 Function Documentation

# 7.22.2.1 AK\_check\_folder\_blobs()

```
int AK_check_folder_blobs ( )
```

Function that checks if folder blobs exists.

**Author** 

Samuel Picek

Returns

OID (object ID)

## 7.22.2.2 AK\_clear\_all\_newline()

## 7.22.2.3 AK\_concat()

```
char* AK_concat (  {\rm char} \ * \ s1, \\ {\rm char} \ * \ s2 \ )
```

Function for AK\_concatinating 2 strings.

Author

Samuel Picek

Returns

returns new string

# 7.22.2.4 AK\_copy()

# 7.22.2.5 AK\_File\_Metadata\_malloc()

```
AK_File_Metadata AK_File_Metadata_malloc ( )
```

# 7.22.2.6 AK\_folder\_exists()

Function that checks if folder blobs already exists.

**Author** 

Samuel Picek

Returns

returns 0 for true and 1 for false

## 7.22.2.7 AK\_GUID()

```
char* AK_GUID ( )
```

Function that generates GUID.

**Author** 

Samuel Picek

Returns

returns globaly universal identifier based on kernel implementation

## 7.22.2.8 AK\_lo\_export()

Function that retrieves large objects.

**Author** 

Samuel Picek

Returns

returns 0 for true and 1 for false

# 7.22.2.9 AK\_lo\_import()

Function that imports large objects to database.

Author

Samuel Picek

Returns

OID (object ID)

# 7.22.2.10 AK\_lo\_test()

```
TestResult AK_lo_test ( )
```

Tests.

**Author** 

Samuel Picek

# 7.22.2.11 AK\_lo\_unlink()

Function that deletes large objects.

**Author** 

Samuel Picek

Returns

OID (object ID)

## 7.22.2.12 AK\_mkdir()

```
int AK_mkdir ( {\rm const~char~*~} path~)
```

Function that creates new folder.

Author

Samuel Picek

Returns

returns 0 for true and 1 for false

# 7.22.2.13 AK\_read\_metadata()

Opens file based on given object id, copies metadata from it and returns as result.

**Author** 

Unknown

Returns

If the given file can't be open it returns -1, else it returns fetched metadata.

## 7.22.2.14 AK\_split\_path\_file()

Function that splits a path from filename.

**Author** 

Samuel Picek

Returns

void

## 7.22.2.15 AK\_write\_metadata()

Function that opens an existing file in write mode and writes formatted output in it.

Author

Unknown

Returns

If the given file name doesn't exist, it returns -1, else 0.

# 7.22.3 Variable Documentation

#### 7.22.3.1 failed

```
int failed = 0
```

### 7.22.3.2 success

```
int success = 0
```

## 7.23 file/blobs.h File Reference

```
#include "../auxi/test.h"
#include "table.h"
#include "fileio.h"
#include "id.h"

Include dependency graph for blobs.h: This graph shows which files directly or indirectly include this file:

#### Classes

· struct file metadata

## **Typedefs**

- typedef struct \_file\_metadata AK\_Metadata
- typedef struct \_file\_metadata \* AK\_File\_Metadata

### **Functions**

- AK\_File\_Metadata AK\_File\_Metadata\_malloc ()
- int AK\_mkdir (const char \*path)

Function that creates new folder.

- int AK\_copy (const char \*from, const char \*to)
- char \* AK\_concat (char \*s1, char \*s2)

Function for AK\_concatinating 2 strings.

- char \* AK\_clear\_all\_newline (char \*str)
- void AK\_split\_path\_file (char \*\*p, char \*\*f, char \*pf)

Function that splits a path from filename.

• char \* AK\_GUID ()

Function that generates GUID.

• int AK\_folder\_exists (char \*foldername)

Function that checks if folder blobs already exists.

• int AK\_check\_folder\_blobs ()

Function that checks if folder blobs exists.

• int AK\_write\_metadata (char \*oid, AK\_File\_Metadata meta)

Function that opens an existing file in write mode and writes formatted output in it.

AK\_File\_Metadata AK\_read\_metadata (char \*oid)

Opens file based on given object id, copies metadata from it and returns as result.

char \* AK\_lo\_import (char \*filepath)

Function that imports large objects to database.

• int AK\_lo\_export (char \*oid, char \*filepath)

Function that retrieves large objects.

int AK\_lo\_unlink (char \*oid)

Function that deletes large objects.

TestResult AK\_lo\_test ()

Tests.

# 7.23.1 Detailed Description

Provides data structures, functions and defines for manipulating blobs

# 7.23.2 Typedef Documentation

## 7.23.2.1 AK\_File\_Metadata

```
typedef struct _file_metadata* AK_File_Metadata
```

## 7.23.2.2 AK\_Metadata

```
typedef struct _file_metadata AK_Metadata
```

## 7.23.3 Function Documentation

## 7.23.3.1 AK\_check\_folder\_blobs()

```
int AK_check_folder_blobs ( )
```

Function that checks if folder blobs exists.

**Author** 

Samuel Picek

Returns

OID (object ID)

# 7.23.3.2 AK\_clear\_all\_newline()

# 7.23.3.3 AK\_concat()

Function for AK\_concatinating 2 strings.

**Author** 

Samuel Picek

Returns

returns new string

# 7.23.3.4 AK\_copy()

## 7.23.3.5 AK\_File\_Metadata\_malloc()

```
AK_File_Metadata AK_File_Metadata_malloc ( )
```

# 7.23.3.6 AK\_folder\_exists()

Function that checks if folder blobs already exists.

**Author** 

Samuel Picek

Returns

returns 0 for true and 1 for false

# 7.23.3.7 AK\_GUID()

```
char* AK_GUID ( )
```

Function that generates GUID.

**Author** 

Samuel Picek

Returns

returns globaly universal identifier based on kernel implementation

## 7.23.3.8 AK\_lo\_export()

Function that retrieves large objects.

**Author** 

Samuel Picek

Returns

returns 0 for true and 1 for false

### 7.23.3.9 AK\_lo\_import()

Function that imports large objects to database.

Author

Samuel Picek

Returns

OID (object ID)

# 7.23.3.10 AK\_lo\_test()

```
TestResult AK_lo_test ( )
Tests.
```

Author

Samuel Picek

## 7.23.3.11 AK\_lo\_unlink()

Function that deletes large objects.

Author

Samuel Picek

Returns

OID (object ID)

# 7.23.3.12 AK\_mkdir()

Function that creates new folder.

Author

Samuel Picek

Returns

returns 0 for true and 1 for false

### 7.23.3.13 AK\_read\_metadata()

Opens file based on given object id, copies metadata from it and returns as result.

**Author** 

Unknown

Returns

If the given file can't be open it returns -1, else it returns fetched metadata.

### 7.23.3.14 AK\_split\_path\_file()

Function that splits a path from filename.

Author

Samuel Picek

Returns

void

### 7.23.3.15 AK\_write\_metadata()

Function that opens an existing file in write mode and writes formatted output in it.

Author

Unknown

Returns

If the given file name doesn't exist, it returns -1, else 0.

### 7.24 file/fileio.c File Reference

#include "fileio.h"
Include dependency graph for fileio.c:

#### **Functions**

 void AK\_Insert\_New\_Element\_For\_Update (int newtype, void \*data, char \*table, char \*attribute\_name, struct list\_node \*ElementBefore, int newconstraint)

!! YOU PROBABLY DON'T WANT TO USE THIS FUNCTION!! - Use AK\_Update\_Existing\_Element or AK\_Insert 
\_New\_Element instead. Function inserts new element after some element, to insert on first place give list as before element. New element is allocated. Type, data, attribute name and constraint of new elemets are set according to function arguments. Pointers are changed so that before element points to new element.

• void AK\_Update\_Existing\_Element (int newtype, void \*data, char \*table, char \*attribute\_name, struct list node \*ElementBefore)

Used to add a constraint attribute which will define what element gets updated when the operation is executed.

 void AK\_Insert\_New\_Element (int newtype, void \*data, char \*table, char \*attribute\_name, struct list\_node \*ElementBefore)

Used to add a new element after some element, to insert on first place give list as before element. It calls function AK\_Insert\_New\_Element\_For\_Update.

• int AK\_insert\_row\_to\_block (struct list\_node \*row\_root, AK\_block \*temp\_block)

Function inserts one row into some block. Firstly it checks wether block contain attributes from the list. Then data, type, size and last\_tuple\_id are put in temp\_block.

int AK insert row (struct list node \*row root)

Function inserts a one row into table. Firstly it is checked whether inserted row would violite reference integrity. Then it is checked in which table should row be inserted. If there is no AK\_free space for new table, new extent is allocated. New block is allocated on given address. Row is inserted in this block and dirty flag is set to BLOCK\_DIRTY.

• int AK\_update\_row\_from\_block (AK\_block \*temp\_block, struct list\_node \*row\_root)

Function updates row from table in given block if the data in the table is equal to data in attribute used for search.

void AK delete row from block (AK block \*temp block, struct list node \*row root)

Function deletes row from table in given block. Given list of elements is firstly back-upped.

int AK\_delete\_update\_segment (struct list\_node \*row\_root, int del)

Function updates or deletes the whole segment of an table. Addresses for given table atr fetched. For each block in extent row is updated or deleted according to operator del.

int AK\_delete\_row (struct list\_node \*row\_root)

Function deletes rows.

void AK\_delete\_row\_by\_id (int id, char \*tableName)

Function deletes row by id.

int AK\_update\_row (struct list\_node \*row\_root)

Function updates rows of some table.

• TestResult AK\_fileio\_test ()

### 7.24.1 Detailed Description

Provides functions for file input/output

#### 7.24.2 Function Documentation

## 7.24.2.1 AK\_delete\_row()

Function deletes rows.

**Author** 

Matija Novak, Dejan Frankovic (added referential integrity)

#### **Parameters**

```
row_root elements of one row @returs EXIT_SUCCESS if success
```

### 7.24.2.2 AK\_delete\_row\_by\_id()

```
void AK_delete_row_by_id (  \mbox{int $id$,} \\ \mbox{char } * tableName \mbox{)}
```

Function deletes row by id.

**Author** 

Dražen Bandić

#### **Parameters**

id	id of row
tableName	name of table to delete the row

## 7.24.2.3 AK\_delete\_row\_from\_block()

Function deletes row from table in given block. Given list of elements is firstly back-upped.

**Author** 

Matija Novak, updated by Dino Laktašić, changed by Davorin Vukelic, updated by Mario Peroković

#### **Parameters**

temp_block	block to work with
row_list	list of elements which contain data for delete or update

#### Returns

No return value

### 7.24.2.4 AK\_delete\_update\_segment()

Function updates or deletes the whole segment of an table. Addresses for given table atr fetched. For each block in extent row is updated or deleted according to operator del.

### **Author**

Matija Novak, updated by Matija Šestak (function now uses caching)

#### **Parameters**

row_root	elements of one row
del	- DELETE or UPDATE

#### Returns

EXIT\_SUCCESS if success

### 7.24.2.5 AK\_fileio\_test()

```
TestResult AK_fileio_test ( )
```

### 7.24.2.6 AK\_Insert\_New\_Element()

```
void AK_Insert_New_Element (
          int newtype,
          void * data,
          char * table,
          char * attribute_name,
          struct list_node * ElementBefore )
```

Used to add a new element after some element, to insert on first place give list as before element. It calls function AK\_Insert\_New\_Element\_For\_Update.

#### Author

Matija Novak, changed by Dino Laktašić

#### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	is NEW_VALUE

#### Returns

No return value

#### 7.24.2.7 AK Insert New Element For Update()

```
void AK_Insert_New_Element_For_Update (
    int newtype,
    void * data,
    char * table,
    char * attribute_name,
    struct list_node * ElementBefore,
    int newconstraint )
```

!! YOU PROBABLY DON'T WANT TO USE THIS FUNCTION!! - Use AK\_Update\_Existing\_Element or AK\_Insert ← \_New\_Element instead. Function inserts new element after some element, to insert on first place give list as before element. New element is allocated. Type, data, attribute name and constraint of new elements are set according to function arguments. Pointers are changed so that before element points to new element.

#### **Author**

Matija Novak

#### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	NEW_VALUE if data is new value, SEARCH_CONSTRAINT if data is constraint to search for

#### Returns

No return value

#### 7.24.2.8 AK\_insert\_row()

Function inserts a one row into table. Firstly it is checked whether inserted row would violite reference integrity. Then it is checked in which table should row be inserted. If there is no AK\_free space for new table, new extent is allocated. New block is allocated on given address. Row is inserted in this block and dirty flag is set to BLOCK\_
DIRTY.

#### **Author**

Matija Novak, updated by Matija Šestak (function now uses caching), updated by Dejan Frankovic (added reference check), updated by Dino Laktašić (removed variable AK\_free, variable table initialized using memset), updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

#### Returns

EXIT\_SUCCESS if success else EXIT\_ERROR

#### 7.24.2.9 AK\_insert\_row\_to\_block()

Function inserts one row into some block. Firstly it checks wether block contain attributes from the list. Then data, type, size and last\_tuple\_id are put in temp\_block.

#### **Author**

Matija Novak, updated by Dino Laktašić

#### **Parameters**

row_root	list of elements to insert
temp_block	block in which we insert data

#### Returns

**EXIT SUCCES if success** 

## 7.24.2.10 AK\_Update\_Existing\_Element()

```
void AK_Update_Existing_Element (
    int newtype,
    void * data,
    char * table,
    char * attribute_name,
    struct list_node * ElementBefore )
```

Used to add a constraint attribute which will define what element gets updated when the operation is executed.

### Author

Igor Rinkovec

#### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	is NEW_VALUE

#### Returns

No return value

## 7.24.2.11 AK\_update\_row()

Function updates rows of some table.

#### **Author**

Matija Novak, Dejan Frankovic (added referential integrity)

### **Parameters**

row_root	elements of one row

### Returns

EXIT\_SUCCESS if success

#### 7.24.2.12 AK\_update\_row\_from\_block()

Function updates row from table in given block if the data in the table is equal to data in attribute used for search.

Function updates row from table in given block.

#### **Author**

Matija Novak, updated by Dino Laktašić, updated by Mario Peroković - separated from deletion, updated by Antun Tkalčec (fixed SIGSEGV)

#### **Parameters**

temp_block	block to work with
row_list	list of elements which contain data for delete or update

#### Returns

Returns an "EXIT SUCCESS"

## 7.25 file/fileio.h File Reference

```
#include "../auxi/test.h"
#include "../auxi/constants.h"
#include "../sql/cs/reference.h"
#include "../mm/memoman.h"
#include "../rec/recovery.h"
#include "../rec/archive_log.h"
#include "../rec/redo_log.h"
```

Include dependency graph for fileio.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

• void AK\_Insert\_New\_Element\_For\_Update (int newtype, void \*data, char \*table, char \*attribute\_name, struct list\_node \*ElementBefore, int newconstraint)

!! YOU PROBABLY DON'T WANT TO USE THIS FUNCTION !! - Use AK\_Update\_Existing\_Element or AK\_Insert 
\_\_New\_Element instead. Function inserts new element after some element, to insert on first place give list as before element. New element is allocated. Type, data, attribute name and constraint of new elemets are set according to function arguments. Pointers are changed so that before element points to new element.

 void AK\_Insert\_New\_Element (int newtype, void \*data, char \*table, char \*attribute\_name, struct list\_node \*ElementBefore)

Used to add a new element after some element, to insert on first place give list as before element. It calls function AK\_Insert\_New\_Element\_For\_Update.

int AK\_insert\_row\_to\_block (struct list\_node \*row\_root, AK\_block \*temp\_block)

Function inserts one row into some block. Firstly it checks wether block contain attributes from the list. Then data, type, size and last\_tuple\_id are put in temp\_block.

• int AK\_insert\_row (struct list\_node \*row\_root)

Function inserts a one row into table. Firstly it is checked whether inserted row would violite reference integrity. Then it is checked in which table should row be inserted. If there is no AK\_free space for new table, new extent is allocated. New block is allocated on given address. Row is inserted in this block and dirty flag is set to BLOCK\_DIRTY.

int AK\_update\_row\_from\_block (AK\_block \*temp\_block, struct list\_node \*row\_root)

Function updates row from table in given block.

void AK\_delete\_row\_from\_block (AK\_block \*temp\_block, struct list\_node \*row\_root)

Function deletes row from table in given block. Given list of elements is firstly back-upped.

• int AK\_delete\_update\_segment (struct list\_node \*row\_root, int del)

Function updates or deletes the whole segment of an table. Addresses for given table atr fetched. For each block in extent row is updated or deleted according to operator del.

int AK delete row (struct list node \*row root)

Function deletes rows.

int AK\_update\_row (struct list\_node \*row\_root)

Function updates rows of some table.

- TestResult AK\_fileio\_test ()
- void AK\_delete\_row\_by\_id (int id, char \*tableName)

Function deletes row by id.

## 7.25.1 Detailed Description

Header file provides functions and defines for file input/output

#### 7.25.2 Function Documentation

## 7.25.2.1 AK\_delete\_row()

Function deletes rows.

Author

Matija Novak, Dejan Frankovic (added referential integrity)

#### **Parameters**

```
row_root | elements of one row @returs EXIT_SUCCESS if success
```

#### 7.25.2.2 AK delete row by id()

Function deletes row by id.

**Author** 

Dražen Bandić

### **Parameters**

id	id of row
tableName	name of table to delete the row

### 7.25.2.3 AK\_delete\_row\_from\_block()

Function deletes row from table in given block. Given list of elements is firstly back-upped.

Author

Matija Novak, updated by Dino Laktašić, changed by Davorin Vukelic, updated by Mario Peroković

#### **Parameters**

temp_block	block to work with
row_list	list of elements which contain data for delete or update

### Returns

No return value

# 7.25.2.4 AK\_delete\_update\_segment()

Function updates or deletes the whole segment of an table. Addresses for given table atr fetched. For each block in extent row is updated or deleted according to operator del.

### Author

Matija Novak, updated by Matija Šestak (function now uses caching)

### **Parameters**

row_root	elements of one row
del	- DELETE or UPDATE

#### Returns

EXIT\_SUCCESS if success

## 7.25.2.5 AK\_fileio\_test()

```
TestResult AK_fileio_test ( )
```

### 7.25.2.6 AK\_Insert\_New\_Element()

Used to add a new element after some element, to insert on first place give list as before element. It calls function AK\_Insert\_New\_Element\_For\_Update.

#### **Author**

Matija Novak, changed by Dino Laktašić

### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	is NEW VALUE

# Returns

No return value

#### 7.25.2.7 AK\_Insert\_New\_Element\_For\_Update()

```
void AK_Insert_New_Element_For_Update (
    int newtype,
    void * data,
    char * table,
    char * attribute_name,
    struct list_node * ElementBefore,
    int newconstraint )
```

!! YOU PROBABLY DON'T WANT TO USE THIS FUNCTION!! - Use AK\_Update\_Existing\_Element or AK\_Insert 
\_New\_Element instead. Function inserts new element after some element, to insert on first place give list as before element. New element is allocated. Type, data, attribute name and constraint of new elements are set according to function arguments. Pointers are changed so that before element points to new element.

#### **Author**

Matija Novak

#### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	NEW_VALUE if data is new value, SEARCH_CONSTRAINT if data is constraint to search for

#### Returns

No return value

### 7.25.2.8 AK\_insert\_row()

Function inserts a one row into table. Firstly it is checked whether inserted row would violite reference integrity. Then it is checked in which table should row be inserted. If there is no AK\_free space for new table, new extent is allocated. New block is allocated on given address. Row is inserted in this block and dirty flag is set to BLOCK\_
DIRTY.

#### **Author**

Matija Novak, updated by Matija Šestak (function now uses caching), updated by Dejan Frankovic (added reference check), updated by Dino Laktašić (removed variable AK free, variable table initialized using memset)

#### **Parameters**

row_root	list of elements which contain data of one row
----------	--

### Returns

EXIT\_SUCCESS if success else EXIT\_ERROR

#### **Author**

Matija Novak, updated by Matija Šestak (function now uses caching), updated by Dejan Frankovic (added reference check), updated by Dino Laktašić (removed variable AK\_free, variable table initialized using memset), updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

row_root list of elen	nents which contain data of one row
-----------------------	-------------------------------------

#### Returns

EXIT\_SUCCESS if success else EXIT\_ERROR

### 7.25.2.9 AK\_insert\_row\_to\_block()

Function inserts one row into some block. Firstly it checks wether block contain attributes from the list. Then data, type, size and last\_tuple\_id are put in temp\_block.

#### **Author**

Matija Novak, updated by Dino Laktašić

#### **Parameters**

row_root	list of elements to insert
temp_block	block in which we insert data

#### Returns

**EXIT SUCCES if success** 

## 7.25.2.10 AK\_update\_row()

Function updates rows of some table.

**Author** 

Matija Novak, Dejan Frankovic (added referential integrity)

#### **Parameters**

row_root ele	ements of one row
--------------	-------------------

#### Returns

EXIT\_SUCCESS if success

### 7.25.2.11 AK\_update\_row\_from\_block()

Function updates row from table in given block.

Author

Matija Novak, updated by Dino Laktašić, updated by Mario Peroković - separated from deletion

#### **Parameters**

temp_block	block to work with
row_list	list of elements which contain data for delete or update

#### Returns

No return value

Function updates row from table in given block.

## Author

Matija Novak, updated by Dino Laktašić, updated by Mario Peroković - separated from deletion, updated by Antun Tkalčec (fixed SIGSEGV)

#### **Parameters**

temp_block	block to work with
row_list	list of elements which contain data for delete or update

#### Returns

Returns an "EXIT\_SUCCESS"

## 7.26 file/files.c File Reference

```
#include "files.h"
#include <pthread.h>
Include dependency graph for files.c:
```

### **Functions**

- int AK\_initialize\_new\_segment (char \*name, int type, AK\_header \*header)
  - Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.
- int AK\_initialize\_new\_index\_segment (char \*name, char \*table\_id, int attr\_id, AK\_header \*header)

  Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.
- TestResult AK\_files\_test ()

Test function.

### **Variables**

• pthread\_mutex\_t fileMut = PTHREAD\_MUTEX\_INITIALIZER

## 7.26.1 Detailed Description

Header file provides functions for file management

# 7.26.2 Function Documentation

#### 7.26.2.1 AK\_files\_test()

```
TestResult AK_files_test ( )
Test function.
Author
```

Returns

No return value

Unknown

#### 7.26.2.2 AK\_initialize\_new\_index\_segment()

Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.

#### **Author**

Tomislav Fotak, updated by Matija Šestak (function now uses caching), reused by Lovro Predovan

#### **Parameters**

name	segment name
type	segment type
header	pointer to header that should be written to the new extent (all blocks)

### Returns

start address of new segment

# 7.26.2.3 AK\_initialize\_new\_segment()

Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.

#### **Author**

Tomislav Fotak, updated by Matija Šestak (function now uses caching)

### **Parameters**

name	segment name
type	segment type
header	pointer to header that should be written to the new extent (all blocks)

Returns

start address of new segment

#### 7.26.3 Variable Documentation

#### 7.26.3.1 fileMut

```
pthread_mutex_t fileMut = PTHREAD_MUTEX_INITIALIZER
```

## 7.27 file/files.h File Reference

```
#include "../auxi/test.h"
#include "id.h"
#include "../auxi/mempro.h"
```

Include dependency graph for files.h: This graph shows which files directly or indirectly include this file:

### **Functions**

- int AK\_initialize\_new\_segment (char \*name, int type, AK\_header \*header)
  - Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.
- int AK\_initialize\_new\_index\_segment (char \*name, char \*table\_id, int attr\_id, AK\_header \*header)
  - Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.
- TestResult AK\_files\_test ()

Test function.

## 7.27.1 Detailed Description

Header file that provides functions and defines for file management

### 7.27.2 Function Documentation

## 7.27.2.1 AK\_files\_test()

```
TestResult AK_files_test ( )
```

Test function.

**Author** 

Unknown

Returns

No return value

## 7.27.2.2 AK\_initialize\_new\_index\_segment()

Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.

Author

Tomislav Fotak, updated by Matija Šestak (function now uses caching), reused by Lovro Predovan

### Parameters

name	segment name
type	segment type
header	pointer to header that should be written to the new extent (all blocks)

#### Returns

start address of new segment

### 7.27.2.3 AK\_initialize\_new\_segment()

Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.

#### **Author**

Tomislav Fotak, updated by Matija Šestak (function now uses caching)

#### **Parameters**

name	segment name	
type	segment type	
header	pointer to header that should be written to the new extent (all blocks)	

#### Returns

start address of new segment

### 7.28 file/filesearch.c File Reference

```
#include "filesearch.h"
Include dependency graph for filesearch.c:
```

### **Functions**

search\_result AK\_search\_unsorted (char \*szRelation, search\_params \*aspParams, int iNum\_search\_
params)

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_INTERVAL, TYPE\_PERIOD. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

void AK\_deallocate\_search\_result (search\_result srResult)

Function that deallocates memory used by the search result returned by AK\_search\_unsorted.

• TestResult AK\_filesearch\_test ()

Function that tests file search.

## 7.28.1 Detailed Description

Provides functions for file searching

### 7.28.2 Function Documentation

### 7.28.2.1 AK\_deallocate\_search\_result()

Function that deallocates memory used by the search result returned by AK\_search\_unsorted.

**Author** 

Miroslav Policki

#### **Parameters**

srResult search result

Returns

No return value

### 7.28.2.2 AK\_filesearch\_test()

```
TestResult AK_filesearch_test ( )
```

Function that tests file search.

**Author** 

Miroslav Policki

Returns

No return value

#### 7.28.2.3 AK\_search\_unsorted()

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_T IME, TYPE\_INTERVAL, TYPE\_PERIOD. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_TI  $\leftarrow$  ME. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

Author

Miroslav Policki

#### **Parameters**

szRelation	relation name
aspParams	array of search parameters
iNum_search_params	number of search parameters

#### Returns

search\_result structure defined in filesearch.h. Use AK\_deallocate\_search\_result to deallocate.

iterate through all the blocks

count number of attributes in segment/relation

determine index of attributes on which search will be performed

if any of the provided attributes are not found in the relation, return empty result

in every tuple, for all required attributes, compare attribute value with searched-for value and store matched tuple addresses

## 7.29 file/filesearch.h File Reference

```
#include "../auxi/test.h"
#include "../mm/memoman.h"
#include "files.h"
#include "../auxi/mempro.h"
```

Include dependency graph for filesearch.h: This graph shows which files directly or indirectly include this file:

### **Classes**

struct search\_params

Structure that contains attribute name, lower and upper data value, special(NULL or \*) which is input for AK\_\cup equisearch\_unsorted and AK\_rangesearch\_unsorted.

· struct search result

Structure which represents search result of AK\_equisearch\_unsorted and AK\_rangesearch\_unsorted.

## **Macros**

- #define SEARCH\_NULL 0
- #define SEARCH\_ALL 1
- #define SEARCH\_PARTICULAR 2
- #define SEARCH\_RANGE 3

#### **Functions**

search\_result AK\_search\_unsorted (char \*szRelation, search\_params \*aspParams, int iNum\_search\_
params)

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_TIME. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

void AK\_deallocate\_search\_result (search\_result srResult)

Function that deallocates memory used by the search result returned by AK\_search\_unsorted.

TestResult AK filesearch test ()

Function that tests file search.

## 7.29.1 Detailed Description

Header file provides data structures, functions and defines for file searching

### 7.29.2 Macro Definition Documentation

#### 7.29.2.1 SEARCH ALL

#define SEARCH\_ALL 1

### 7.29.2.2 SEARCH\_NULL

#define SEARCH\_NULL 0

### 7.29.2.3 SEARCH\_PARTICULAR

#define SEARCH\_PARTICULAR 2

#### 7.29.2.4 SEARCH RANGE

#define SEARCH\_RANGE 3

# 7.29.3 Function Documentation

# 7.29.3.1 AK\_deallocate\_search\_result()

Function that deallocates memory used by the search result returned by AK\_search\_unsorted.

**Author** 

Miroslav Policki

### **Parameters**

#### Returns

No return value

## 7.29.3.2 AK\_filesearch\_test()

```
TestResult AK_filesearch_test ( )
```

Function that tests file search.

**Author** 

Miroslav Policki

Returns

No return value

#### 7.29.3.3 AK\_search\_unsorted()

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_TI  $\leftarrow$  ME. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

#### **Author**

Miroslav Policki

#### **Parameters**

szRelation	relation name
aspParams	array of search parameters
iNum_search_params	number of search parameters

#### Returns

search\_result structure defined in filesearch.h. Use AK\_deallocate\_search\_result to deallocate.

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_TI  $\leftarrow$  ME. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

### Author

Miroslav Policki

#### Parameters

szRelation	relation name
aspParams	array of search parameters
iNum_search_params	number of search parameters

#### Returns

search\_result structure defined in filesearch.h. Use AK\_deallocate\_search\_result to deallocate.

iterate through all the blocks

count number of attributes in segment/relation

determine index of attributes on which search will be performed

if any of the provided attributes are not found in the relation, return empty result

in every tuple, for all required attributes, compare attribute value with searched-for value and store matched tuple addresses

## 7.30 file/filesort.c File Reference

```
#include "filesort.h"
Include dependency graph for filesort.c:
```

### **Functions**

int AK\_get\_total\_headers (AK\_block \*iBlock)

Function that returns the total number of headers in the block.

int AK\_get\_header\_number (AK\_block \*iBlock, char \*attribute\_name)

Function that returns the number of header in the block which to sort.

int AK\_get\_num\_of\_tuples (AK\_block \*iBlock)

Function that returns tuples number in block.

int AK\_sort\_segment (char \*srcTable, char \*destTable, struct list\_node \*attributes)

Function that sorts a segment.

void AK\_reset\_block (AK\_block \*block)

Function that resets block.

void AK\_block\_sort (AK\_block \*iBlock, char \*attribute\_name)

Function that sorts the given block.

TestResult AK\_filesort\_test ()

#### 7.30.1 Function Documentation

#### 7.30.1.1 AK block sort()

Function that sorts the given block.

**Author** 

Bakoš Nikola

Version

v1.0

#### **Parameters**

iBlock	block to be sorted
--------	--------------------

Returns

No return value

# 7.30.1.2 AK\_filesort\_test()

```
TestResult AK_filesort_test ( )
```

## 7.30.1.3 AK\_get\_header\_number()

Function that returns the number of header in the block which to sort.

**Author** 

Unknown

Returns

number of attribute in header (0 - MAX\_ATTRIBUTES). USE in tuple\_dict[num]...

### 7.30.1.4 AK\_get\_num\_of\_tuples()

Function that returns tuples number in block.

Author

Unknown

Returns

tuples number in block

### 7.30.1.5 AK\_get\_total\_headers()

```
int AK_get_total_headers ( {\tt AK\_block} \ * \ iBlock \ )
```

Function that returns the total number of headers in the block.

**Author** 

Unknown

Returns

number of attribute in header (0 - MAX\_ATTRIBUTES). USE in tuple\_dict[num]...

# 7.30.1.6 AK\_reset\_block()

Function that resets block.

Author

Unknown

**Parameters** 

```
block block to be resetted
```

Returns

No return value

# 7.30.1.7 AK\_sort\_segment()

Function that sorts a segment.

**Author** 

Tomislav Bobinac, updated by Filip Žmuk

Todo Make it to suport multiple sort atributes and ASC DESC ordering

Returns

No return value.

# 7.31 file/filesort.h File Reference

```
#include "../auxi/test.h"
#include "../mm/memoman.h"
#include "table.h"
#include "files.h"
#include "fileio.h"
#include "../auxi/mempro.h"
```

Include dependency graph for filesort.h: This graph shows which files directly or indirectly include this file:

#### **Macros**

• #define DATA ROW SIZE 200

Constatnt declaring size of data to be compared.

• #define DATA\_TUPLE\_SIZE 500

Constant declaring size of data to be copied.

### **Functions**

• int AK\_get\_total\_headers (AK\_block \*iBlock)

Function that returns the total number of headers in the block.

• int AK\_get\_header\_number (AK\_block \*iBlock, char \*attribute\_name)

Function that returns the number of header in the block which to sort.

• int AK\_get\_num\_of\_tuples (AK\_block \*iBlock)

Function that returns tuples number in block.

• int AK\_sort\_segment (char \*srcTable, char \*destTable, struct list\_node \*attributes)

Function that sorts a segment.

void AK\_reset\_block (AK\_block \*block)

Function that resets block.

void AK block sort (AK block \*iBlock, char \*atr name)

Function that sorts the given block.

• TestResult AK\_filesort\_test ()

# 7.31.1 Detailed Description

Header file that provides functions and defines for file sorting

## 7.31.2 Macro Definition Documentation

## 7.31.2.1 DATA\_ROW\_SIZE

```
#define DATA_ROW_SIZE 200
```

Constatnt declaring size of data to be compared.

## 7.31.2.2 DATA\_TUPLE\_SIZE

```
#define DATA_TUPLE_SIZE 500
```

Constant declaring size of data to be copied.

## 7.31.3 Function Documentation

## 7.31.3.1 AK\_block\_sort()

Function that sorts the given block.

Author

Bakoš Nikola

Version

v1.0

**Parameters** 

```
iBlock | block to be sorted
```

Returns

No return value

## 7.31.3.2 AK\_filesort\_test()

```
TestResult AK_filesort_test ( )
```

#### 7.31.3.3 AK get header number()

Function that returns the number of header in the block which to sort.

Author

Unknown

Returns

number of attribute in header (0 - MAX\_ATTRIBUTES). USE in tuple\_dict[num]...

### 7.31.3.4 AK\_get\_num\_of\_tuples()

Function that returns tuples number in block.

Author

Unknown

Returns

tuples number in block

## 7.31.3.5 AK\_get\_total\_headers()

Function that returns the total number of headers in the block.

Author

Unknown

Returns

number of attribute in header (0 - MAX\_ATTRIBUTES). USE in tuple\_dict[num]...

### 7.31.3.6 AK\_reset\_block()

Function that resets block.

**Author** 

Unknown

#### **Parameters**

Returns

No return value

## 7.31.3.7 AK\_sort\_segment()

Function that sorts a segment.

**Author** 

Tomislav Bobinac, updated by Filip Žmuk

Todo Make it to suport multiple sort atributes and ASC|DESC ordering

Returns

No return value.

**Author** 

Tomislav Bobinac, updated by Filip Žmuk

Todo Make it to suport multiple sort atributes and ASC|DESC ordering

Returns

No return value.

## 7.32 file/id.c File Reference

```
#include "id.h"
Include dependency graph for id.c:
```

#### **Functions**

• int AK\_get\_id ()

Function that fetches unique ID for any object, stored in a sequence.

• char AK get table id (char \*tableName)

Function that fetches a unique ID for any object stored in the "AK\_relation" table. It searches for a matching tableName and returns the corresponding objectID in string (char) format.

TestResult AK\_id\_test ()

Function for testing getting ID's.

# 7.32.1 Detailed Description

Provides functions for creating id of objects

### 7.32.2 Function Documentation

### 7.32.2.1 AK\_get\_id()

```
int AK_get_id ( )
```

Function that fetches unique ID for any object, stored in a sequence.

**Author** 

Saša Vukšić, updated by Mislav Čakarić, changed by Mario Peroković, now uses AK\_update\_row, updated by Nenad Makar

Returns

objectID

### 7.32.2.2 AK\_get\_table\_id()

Function that fetches a unique ID for any object stored in the "AK\_relation" table. It searches for a matching table  $\leftarrow$  Name and returns the corresponding objectID in string (char) format.

**Author** 

Lovro Predovan, updated by Jakov Gatarić

7.33 file/id.h File Reference 303

#### **Parameters**

tableName	The name of the object for which the ID is going to be fetched.
-----------	---

#### Returns

The objectID in string (char) format. If no matching tableName is found, it returns 0.

## 7.32.2.3 AK\_id\_test()

```
TestResult AK_id_test ( )
```

Function for testing getting ID's.

**Author** 

Mislav Čakarić, updated by Nenad Makar

Returns

No return value

# 7.33 file/id.h File Reference

```
#include "../auxi/test.h"
#include "table.h"
#include "fileio.h"
#include "../auxi/mempro.h"
```

Include dependency graph for id.h: This graph shows which files directly or indirectly include this file:

### **Macros**

• #define ID\_START\_VALUE 100

Constant declaring start value of id.

### **Functions**

• int AK\_get\_id ()

Function that fetches unique ID for any object, stored in a sequence.

TestResult AK\_id\_test ()

Function for testing getting ID's.

## 7.33.1 Detailed Description

Provides functions and defines for creating id of objects

## 7.33.2 Macro Definition Documentation

## 7.33.2.1 ID\_START\_VALUE

```
#define ID_START_VALUE 100
```

Constant declaring start value of id.

#### 7.33.3 Function Documentation

# 7.33.3.1 AK\_get\_id()

```
int AK_get_id ( )
```

Function that fetches unique ID for any object, stored in a sequence.

**Author** 

Saša Vukšić, updated by Mislav Čakarić, changed by Mario Peroković, now uses AK\_update\_row, updated by Nenad Makar

Returns

objectID

### 7.33.3.2 AK\_id\_test()

```
TestResult AK_id_test ( )
```

Function for testing getting ID's.

**Author** 

Mislav Čakarić, updated by Nenad Makar

Returns

No return value

# 7.34 file/idx/bitmap.c File Reference

```
#include "bitmap.h"
#include "../../auxi/iniparser.h"
Include dependency graph for bitmap.c:
```

#### **Functions**

• int AK\_If\_ExistOp (struct list\_node \*L, char \*ele)

Function that examines whether list L contains operator ele.

void AK\_create\_Index\_Table (char \*tblName, struct list\_node \*attributes)

Function that reads table on which we create index and call functions for creating index Elements that will be in index are put in list indexLista and headerAttributes. According to those elements new indexes are created.

void AK\_create\_Index (char \*tblName, char \*tblNameIndex, char \*attributeName, int positionTbl, int num
 Atributes, AK header \*headerIndex)

Function that loads index table with the value of particulary atribute.

list ad \* AK get attribute (char \*indexName, char \*attribute)

Function that gets addresses of the particuliar attribute from bitmap index. It fetches addresses of indexes and header of index table. Using while loop it goes through index and gets necessary data. That data is put in a list called add\_root.

void AK\_print\_Att\_Test (list\_ad \*list)

Function that prints the list of adresses.

list\_ad \* AK\_get\_Attribute (char \*tableName, char \*attributeName, char \*attributeValue)

Function that fetches the values from the bitmap index if there is one for a given table. It should be started when we are making selection on the table with bitmap index.

 void AK\_update (int addBlock, int addTd, char \*tableName, char \*attributeName, char \*attributeValue, char \*newAttributeValue)

Function that updates the index, only on values that alredy exist. If there is no value in bitmap index or bitmap index on this value, warning is showed to the user. Otherwise, bitmap index is updated with new attribute value.

• void AK add to bitmap index (char \*tableName, char \*attributeName)

Function that writes the new value in block when index is updated.

void AK\_print\_Header\_Test (char \*tblName)

Function that tests printing header of table.

void AK\_delete\_bitmap\_index (char \*indexName)

Function that deletes bitmap index based on the name of index.

• TestResult AK bitmap test ()

Function that creates test table and makes index on test table, also prints original tables indexes tables and indexes, tests updating into tables.

# 7.34.1 Detailed Description

Provides functions for bitmap indexes

### 7.34.2 Function Documentation

## 7.34.2.1 AK\_add\_to\_bitmap\_index()

Function that writes the new value in block when index is updated.

Function that updates the index. Function deletes and recreates the index values again if different number of params is detected.

### Author

Saša Vukšić

#### **Parameters**

block   block to write on
---------------------------

### Returns

EXIT\_SUCESS when write operation is successful, otherwise EXIT\_ERROR

#### **Author**

Lovro Predovan

Function that updates the index. Function deletes and recreates the index values again if different number of params is detected

#### **Parameters**

tableName	name of table
attributeName	name of attribute
newAttributeValue	new value of updated attribute

### Returns

No return value

### 7.34.2.2 AK\_bitmap\_test()

```
TestResult AK_bitmap_test ( )
```

Function that creates test table and makes index on test table, also prints original tables indexes tables and indexes, tests updating into tables.

Author

Saša Vukšić updated by Lovro Predovan

Returns

No return value

## 7.34.2.3 AK\_create\_Index()

Function that loads index table with the value of particulary atribute.

**Author** 

Saša Vukšić, Lovro Predovan

#### **Parameters**

tblName	source table
tblNameIndex	new name of index table
attributeName	attribute on which we make index
positionTbl	position of attribute in header of table
numAtributes	number of attributes in table
headerIndex	header of index table

Returns

No return value

# 7.34.2.4 AK\_create\_Index\_Table()

Function that reads table on which we create index and call functions for creating index Elements that will be in index are put in list indexLista and headerAttributes. According to those elements new indexes are created.

**Author** 

Saša Vukšić, Lovro Predovan

### **Parameters**

tblName	name of table
attributes	list of attributes on which we will create indexes

### Returns

No return value

# 7.34.2.5 AK\_delete\_bitmap\_index()

Function that deletes bitmap index based on the name of index.

### **Author**

Lovro Predovan

### **Parameters**

Bitmap	index table name
--------	------------------

#### Returns

No return value

# 7.34.2.6 AK\_get\_attribute()

Function that gets adresses of the particuliar attribute from bitmap index. It fetches addresses of indexes and header of index table. Using while loop it goes through index and gets necessary data. That data is put in a list called add\_root.

## **Author**

Saša Vukšić, Lovro Predovan

indexName	name of index
attribute	name of attribute
attribute	marine or attribute

### Returns

list of adresses

# 7.34.2.7 AK\_get\_Attribute()

Function that fetches the values from the bitmap index if there is one for a given table. It should be started when we are making selection on the table with bitmap index.

### **Author**

Saša Vukšić

### **Parameters**

tableName	name of table
attributeValue	value of attribute

# Returns

list of adresses

# 7.34.2.8 AK\_lf\_ExistOp()

Function that examines whether list L contains operator ele.

### **Author**

Saša Vukšić

L	list of elements	
ele	operator to be found in list	

### Returns

1 if operator ele is found in list, otherwise 0

# 7.34.2.9 AK\_print\_Att\_Test()

Function that prints the list of adresses.

Author

Saša Vukšić, Lovro Predovan

## **Parameters**

```
list of adresses
```

## Returns

No return value

# 7.34.2.10 AK\_print\_Header\_Test()

Function that tests printing header of table.

Author

Saša Vukšić

### **Parameters**

## Returns

No return value

#### 7.34.2.11 AK\_update()

```
void AK_update (
        int addBlock,
        int addTd,
        char * tableName,
        char * attributeName,
        char * attributeValue,
        char * newAttributeValue )
```

Function that updates the index, only on values that alredy exist. If there is no value in bitmap index or bitmap index on this value, warning is showed to the user. Otherwise, bitmap index is updated with new attribute value.

#### **Author**

Saša Vukšić

#### **Parameters**

addBlock	adress of block
addTD	adress of tuple dict
tableName	name of table
attributeName	name of attribute
attributeValue	value of atribute
newAttributeValue	new value of updated attribute

#### Returns

No return value

# 7.35 file/idx/bitmap.h File Reference

```
#include "../../auxi/test.h"
#include "../../mm/memoman.h"
#include "index.h"
#include "../../file/table.h"
#include "../../file/fileio.h"
#include "../../file/files.h"
#include "../../auxi/mempro.h"
```

Include dependency graph for bitmap.h: This graph shows which files directly or indirectly include this file:

### **Functions**

• int AK\_If\_ExistOp (struct list\_node \*L, char \*ele)

Function that examines whether list L contains operator ele.

void AK\_create\_Index\_Table (char \*tblName, struct list\_node \*attributes)

Function that reads table on which we create index and call functions for creating index Elements that will be in index are put in list indexLista and headerAttributes. According to those elements new indexes are created.

void AK\_print\_Header\_Test (char \*tblName)

Function that tests printing header of table.

Function that loads index table with the value of particulary atribute.

list ad \* AK get attribute (char \*indexName, char \*attribute)

Function that gets addresses of the particuliar attribute from bitmap index. It fetches addresses of indexes and header of index table. Using while loop it goes through index and gets necessary data. That data is put in a list called add root.

- void AK\_create\_List\_Address\_Test ()
- void AK\_print\_Att\_Test (list\_ad \*list)

Function that prints the list of adresses.

• list\_ad \* AK\_get\_Attribute (char \*tableName, char \*attributeName, char \*attributeValue)

Function that fetches the values from the bitmap index if there is one for a given table. It should be started when we are making selection on the table with bitmap index.

 void AK\_update (int addBlock, int addTd, char \*tableName, char \*attributeName, char \*attributeValue, char \*newAttributeValue)

Function that updates the index, only on values that alredy exist. If there is no value in bitmap index or bitmap index on this value, warning is showed to the user. Otherwise, bitmap index is updated with new attribute value.

int AK write block (AK block \*block)

Function that writes the new value in block when index is updated.

TestResult AK bitmap test ()

Function that creates test table and makes index on test table, also prints original tables indexes tables and indexes, tests updating into tables.

void AK\_delete\_bitmap\_index (char \*indexName)

Function that deletes bitmap index based on the name of index.

• void AK add to bitmap index (char \*tableName, char \*attributeName)

Function that updates the index. Function deletes and recreates the index values again if different number of params is detected.

## 7.35.1 Detailed Description

Header file that declares functions

### 7.35.2 Function Documentation

### 7.35.2.1 AK\_add\_to\_bitmap\_index()

Function that updates the index. Function deletes and recreates the index values again if different number of params is detected.

**Author** 

Lovro Predovan

### **Parameters**

tableName	name of table
attributeName	name of attribute
newAttributeValue	new value of updated attribute

## Returns

No return value

Function that updates the index. Function deletes and recreates the index values again if different number of params is detected.

### Author

Saša Vukšić

### **Parameters**

write on	block to	block
----------	----------	-------

## Returns

EXIT\_SUCESS when write operation is successful, otherwise EXIT\_ERROR

## Author

Lovro Predovan

Function that updates the index. Function deletes and recreates the index values again if different number of params is detected

# **Parameters**

tableName	name of table
attributeName	name of attribute
newAttributeValue	new value of updated attribute

### Returns

No return value

# 7.35.2.2 AK\_bitmap\_test()

```
TestResult AK_bitmap_test ( )
```

Function that creates test table and makes index on test table, also prints original tables indexes tables and indexes, tests updating into tables.

### Author

Saša Vukšić updated by Lovro Predovan

### Returns

No return value

## 7.35.2.3 AK\_create\_Index()

Function that loads index table with the value of particulary atribute.

### **Author**

Saša Vukšić, Lovro Predovan

#### **Parameters**

tblName	source table
tblNameIndex	new name of index table
attributeName	attribute on which we make index
positionTbl	position of attribute in header of table
numAtributes	number of attributes in table
headerIndex	header of index table

## Returns

No return value

# 7.35.2.4 AK\_create\_Index\_Table()

Function that reads table on which we create index and call functions for creating index Elements that will be in index are put in list indexLista and headerAttributes. According to those elements new indexes are created.

### **Author**

Saša Vukšić, Lovro Predovan

#### **Parameters**

tblName	name of table	
attributes list of attributes on which we will create indexes		

### Returns

No return value

# 7.35.2.5 AK\_create\_List\_Address\_Test()

```
void AK_create_List_Address_Test ( )
```

# 7.35.2.6 AK\_delete\_bitmap\_index()

Function that deletes bitmap index based on the name of index.

### **Author**

Lovro Predovan

### **Parameters**

Bitmap index table name	
-------------------------	--

# Returns

No return value

# 7.35.2.7 AK\_get\_attribute()

Function that gets adresses of the particuliar attribute from bitmap index. It fetches addresses of indexes and header of index table. Using while loop it goes through index and gets necessary data. That data is put in a list called add\_root.

### **Author**

Saša Vukšić, Lovro Predovan

### **Parameters**

indexName	name of index
attribute	name of attribute

### Returns

list of adresses

# 7.35.2.8 AK\_get\_Attribute()

Function that fetches the values from the bitmap index if there is one for a given table. It should be started when we are making selection on the table with bitmap index.

### Author

Saša Vukšić

## **Parameters**

tableName	name of table
attributeValue	value of attribute

## Returns

list of adresses

# 7.35.2.9 AK\_If\_ExistOp()

Function that examines whether list L contains operator ele.

## Author

Saša Vukšić

## **Parameters**

L	list of elements	
ele	operator to be found in list	

## Returns

1 if operator ele is found in list, otherwise 0

# 7.35.2.10 AK\_print\_Att\_Test()

Function that prints the list of adresses.

Author

Saša Vukšić, Lovro Predovan

## **Parameters**

list	list of adresses
------	------------------

# Returns

No return value

# 7.35.2.11 AK\_print\_Header\_Test()

Function that tests printing header of table.

Author

Saša Vukšić

tblName	name of table who's header we are printing
---------	--

### Returns

No return value

# 7.35.2.12 AK\_update()

```
void AK_update (
                int addBlock,
                int addTd,
                char * tableName,
                char * attributeName,
                char * attributeValue,
                 char * newAttributeValue )
```

Function that updates the index, only on values that alredy exist. If there is no value in bitmap index or bitmap index on this value, warning is showed to the user. Otherwise, bitmap index is updated with new attribute value.

### **Author**

Saša Vukšić

## **Parameters**

addBlock	adress of block
addTD	adress of tuple dict
tableName	name of table
attributeName	name of attribute
attributeValue	value of atribute
newAttributeValue	new value of updated attribute

# Returns

No return value

# 7.35.2.13 AK\_write\_block()

```
int AK_write_block ( {\tt AK\_block} \ * \ block \ )
```

Function that writes the new value in block when index is updated.

### Author

Saša Vukšić

#### **Parameters**

block   block to write on
---------------------------

#### Returns

EXIT\_SUCESS when write operation is successful, otherwise EXIT\_ERROR

Function that writes the new value in block when index is updated.

### **Author**

Markus Schatten, updated by Domagoj Šitum (thread-safe enabled)

#### **Parameters**

block	poiner to block allocated in memory to write
-------	--

#### Returns

EXIT\_SUCCESS if successful, EXIT\_ERROR otherwise

## 7.36 file/idx/btree.c File Reference

```
#include "btree.h"
```

Include dependency graph for btree.c:

### **Functions**

AK\_block \* AK\_btree\_create (char \*tblName, struct list\_node \*attributes, char \*indexName)

Function that creates new btree index on integer attribute in table.

• int AK\_btree\_delete (char \*indexName)

Function that deletes index.

int AK\_btree\_search\_delete (char \*indexName, int \*searchValue, int \*endRange, int \*toDo, AK\_block \*inputBlock)

Function that searches or deletes a value in btree index.

• void btree\_delete (btree\_node \*temp, AK\_block \*block, int idNext, int i)

Function that deletes a value in btree index.

• int AK\_btree\_insert (char \*indexName, int \*insertValue, int \*insertTd, int \*insertBlock, AK\_block \*inputBlock)

Function that inserts a value in btree index.

• btree\_node \* makevalues (btree\_node \*temp\_help, int insertValue, int insertTd, int insertBlock, int i)

Function that sets values for node.

int findCorrectNumber (int number)

returns data about a leaf

• btree\_node \* searchValue (int inserted, int insertValue, btree\_node \*temp, btree\_node \*temp\_help, int \*insertTd, int \*insertBlock, int \*increase, int number)

Function that sets values for node.

Function that sets values for node.

• btree\_node \* findPointers (btree\_node \*temp\_node\_one, btree\_node \*temp, int id, int \*nodeInserted, int \*nodeIncrease, int number, int pointerIndex)

Function that sets values for node.

btree\_node \* findValues (btree\_node \*temp\_node\_one, AK\_block \*block, int \*helpAddress, int \*helpType, btree\_node \*value\_help)

Function that sets values for node.

• TestResult AK\_btree\_test ()

Returns the amount of successful and failed tests.

# 7.36.1 Detailed Description

Header file that provides functions for BTree indices

### 7.36.2 Function Documentation

## 7.36.2.1 AK\_btree\_create()

Function that creates new btree index on integer attribute in table.

Author

Anđelko Spevec

### **Parameters**

tblName	- name of the table on which we are creating index
attributes	- attribute on which we are creating index
indexName	- name of the index

### 7.36.2.2 AK\_btree\_delete()

Function that deletes index.

Author

unknown

### **Parameters**

```
indexName - name of the index+
```

# 7.36.2.3 AK\_btree\_insert()

Function that inserts a value in btree index.

**Author** 

unknown

## **Parameters**

indexName	- name of the index
insertValue	- value for insert
insertTd	- index table destination
insertBlock	- block address
inputBlock	- block containing btree
EXIT_SUCCESS	if successful

# 7.36.2.4 AK\_btree\_search\_delete()

Function that searches or deletes a value in btree index.

Author

Anđelko Spevec

# **Parameters**

indexName	- name of the index
searchValue	- value that we are searching in the index
endRange	- if 0 search is for 0 value, else searching in range
toDo	- if 0 we just search else we delete the element if we find it

# 7.36.2.5 AK\_btree\_test()

```
TestResult AK_btree_test ( )
```

Returns the amount of successful and failed tests.

Author

unknown

## Returns

TestResult

# 7.36.2.6 btree\_delete()

Function that deletes a value in btree index.

Author

Anđelko Spevec

temp	- node for deletion
block	- block that contains binary tree
idNext	- index of the node that is to be deleted

# 7.36.2.7 findCorrectNumber()

returns data about a leaf

**Author** 

unknown

Returns

required value

# 7.36.2.8 findPointers()

```
btree_node* findPointers (
          btree_node * temp_node_one,
          btree_node * temp,
          int id,
          int * nodeInserted,
          int * nodeIncrease,
          int number,
          int pointerIndex )
```

Function that sets values for node.

Author

unknown

### **Parameters**

temp_node_one	- node that has it's values set
temp	- node with data about existing node
id	- value to which a pointer of a node is to be set
nodeInserted	- determins if a node has value
nodeIncrease	- shows node that is currently watched
number	- determins the way node values are checked
pointerIndex	- indicates what pointer is used

### Returns

node that has it's values set

# 7.36.2.9 findValues()

```
btree_node* findValues (
          btree_node * temp_node_one,
          AK_block * block,
          int * helpAddress,
          int * helpType,
          btree_node * value_help )
```

Function that sets values for node.

**Author** 

unknown

### **Parameters**

temp_node_one	- node that has it's values set
block	- block containing btree
helpAddress	- address of current node
helpType	- type of current node
value_help	- node in helpAddress

## Returns

node that has it's values set

## 7.36.2.10 makevalues()

```
btree_node* makevalues (
          btree_node * temp_help,
          int insertValue,
          int insertTd,
          int insertBlock,
          int i)
```

Function that sets values for node.

**Author** 

unknown

temp_help	- node that has it's values set
insertValue	- value for insert
insertTd	- index table destination
insertBlock	- block address
i	- determins the index of element of node

### Returns

node that has it's values set

# 7.36.2.11 searchValue()

```
btree_node* searchValue (
    int inserted,
    int insertValue,
    btree_node * temp,
    btree_node * temp_help,
    int * insertTd,
    int * insertBlock,
    int * increase,
    int number )
```

Function that sets values for node.

### **Author**

unknown

### **Parameters**

inserted	- determins if a value in a tree smaller then the value for insert has been found
insertValue	- value for insert
temp	- node with data about existing node
temp_help	- node that has it's values set
insertTd	- index table destination
insertBlock	- block address
increase	- determins the index of element of a node
number	- gives information about the number of elements in a leaf

## Returns

node that has it's values set

## 7.36.2.12 setNodePointers()

```
btree_node* setNodePointers (
          btree_node * temp,
          btree_node * temp_help,
          int pointerIndex,
          int secondValue,
          int firstPointer,
          int secondPointer)
```

Function that sets values for node.

#### Author

unknown

#### **Parameters**

temp	- node with data about existing node
temp_help	- node that has it's values set
pointerIndex	- indicates what pointer is used
secondValue	- value of a node
firstPointer	- value to which a pointer of a node is to be set
secondPointer	- value to which a pointer of a node is to be set

#### Returns

node that has it's values set

# 7.37 file/idx/btree.h File Reference

## Classes

- struct btree\_node
- · struct root info

## **Macros**

- #define B 3
- #define ORDER 6
- #define LEAF 0
- #define NODE 1

## **Functions**

• AK\_block \* AK\_btree\_create (char \*tblName, struct list\_node \*attributes, char \*indexName)

Function that creates new btree index on integer attribute in table.

• int AK\_btree\_delete (char \*indexName)

Function that deletes index.

• btree\_node \* makevalues (btree\_node \*temp\_help, int insertValue, int insertTd, int insertBlock, int i)

Function that sets values for node.

• btree\_node \* searchValue (int inserted, int insertValue, btree\_node \*temp, btree\_node \*temp\_help, int \*insertTd, int \*insertBlock, int \*increase, int number)

Function that sets values for node.

• btree\_node \* setNodePointers (btree\_node \*temp, btree\_node \*temp\_help, int pointerIndex, int second 
Value, int firstPointer, int secondPointer)

Function that sets values for node.

int findCorrectNumber (int number)

returns data about a leaf

• btree\_node \* findPointers (btree\_node \*temp\_node\_one, btree\_node \*temp, int id, int \*nodeInserted, int \*nodeIncrease, int number, int pointerIndex)

Function that sets values for node.

btree\_node \* findValues (btree\_node \*temp\_node\_one, AK\_block \*block, int \*helpAddress, int \*helpType, btree\_node \*value\_help)

Function that sets values for node.

void btree\_delete (btree\_node \*temp, AK\_block \*block, int idNext, int i)

Function that deletes a value in btree index.

int AK\_btree\_search\_delete (char \*indexName, int \*searchValue, int \*endRange, int \*toDo, AK\_block \*inputBlock)

Function that searches or deletes a value in btree index.

- int AK\_btree\_insert (char \*indexName, int \*insertValue, int \*insertTd, int \*insertBlock, AK\_block \*inputBlock)
   Function that inserts a value in btree index.
- TestResult AK\_btree\_test ()

Returns the amount of successful and failed tests.

## 7.37.1 Detailed Description

Header file that provides data strucures, functions and defines for BTree indices

## 7.37.2 Macro Definition Documentation

```

# 7.37.3 Function Documentation

# 7.37.3.1 AK\_btree\_create()

Function that creates new btree index on integer attribute in table.

**Author** 

Anđelko Spevec

## **Parameters**

tblName	- name of the table on which we are creating index
attributes	- attribute on which we are creating index
indexName	- name of the index

# 7.37.3.2 AK\_btree\_delete()

Function that deletes index.

**Author** 

unknown

indexName	- name of the index+

# 7.37.3.3 AK\_btree\_insert()

Function that inserts a value in btree index.

### **Author**

unknown

## **Parameters**

indexName	- name of the index
insertValue	- value for insert
insertTd	- index table destination
insertBlock	- block address
inputBlock	- block containing btree
EXIT_SUCCESS	if successful

# 7.37.3.4 AK\_btree\_search\_delete()

Function that searches or deletes a value in btree index.

## Author

Anđelko Spevec

indexName	- name of the index
searchValue	- value that we are searching in the index
endRange	- if 0 search is for 0 value, else searching in range
toDo	- if 0 we just search else we delete the element if we find it

# 7.37.3.5 AK\_btree\_test()

```
TestResult AK_btree_test ( )
```

Returns the amount of successful and failed tests.

Author

unknown

Returns

**TestResult** 

# 7.37.3.6 btree\_delete()

Function that deletes a value in btree index.

Author

Anđelko Spevec

## **Parameters**

temp	- node for deletion
block	- block that contains binary tree
idNext	- index of the node that is to be deleted

# 7.37.3.7 findCorrectNumber()

returns data about a leaf

Author

unknown

Returns

required value

# 7.37.3.8 findPointers()

```
btree_node* findPointers (
          btree_node * temp_node_one,
          btree_node * temp,
          int id,
          int * nodeInserted,
          int * nodeIncrease,
          int number,
          int pointerIndex )
```

Function that sets values for node.

**Author** 

unknown

### **Parameters**

temp_node_one	- node that has it's values set
temp	- node with data about existing node
id	- value to which a pointer of a node is to be set
nodeInserted	- determins if a node has value
nodeIncrease	- shows node that is currently watched
number	- determins the way node values are checked
pointerIndex	- indicates what pointer is used

## Returns

node that has it's values set

## 7.37.3.9 findValues()

```
btree_node* findValues (
          btree_node * temp_node_one,
          AK_block * block,
          int * helpAddress,
          int * helpType,
          btree_node * value_help )
```

Function that sets values for node.

Author

unknown

temp_node_one	- node that has it's values set
block	- block containing btree
Generated by Boxygen	- address of current node
helpType	- type of current node
value_help	- node in helpAddress

### Returns

node that has it's values set

# 7.37.3.10 makevalues()

```
btree_node* makevalues (
          btree_node * temp_help,
          int insertValue,
          int insertTd,
          int insertBlock,
          int i)
```

Function that sets values for node.

Author

unknown

### **Parameters**

temp_help	- node that has it's values set
insertValue	- value for insert
insertTd	- index table destination
insertBlock	- block address
i	- determins the index of element of node

## Returns

node that has it's values set

# 7.37.3.11 searchValue()

```
btree_node* searchValue (
    int inserted,
    int insertValue,
    btree_node * temp,
    btree_node * temp_help,
    int * insertTd,
    int * insertBlock,
    int * increase,
    int number )
```

Function that sets values for node.

### Author

unknown

## **Parameters**

inserted	- determins if a value in a tree smaller then the value for insert has been found
insertValue	- value for insert
temp	- node with data about existing node
temp_help	- node that has it's values set
insertTd	- index table destination
insertBlock	- block address
increase	- determins the index of element of a node
number	- gives information about the number of elements in a leaf

### Returns

node that has it's values set

# 7.37.3.12 setNodePointers()

```
btree_node* setNodePointers (
    btree_node * temp,
    btree_node * temp_help,
    int pointerIndex,
    int secondValue,
    int firstPointer,
    int secondPointer)
```

Function that sets values for node.

# Author

unknown

### **Parameters**

temp	- node with data about existing node
temp_help	- node that has it's values set
pointerIndex	- indicates what pointer is used
secondValue	- value of a node
firstPointer	- value to which a pointer of a node is to be set
secondPointer	- value to which a pointer of a node is to be set

### Returns

node that has it's values set

# 7.38 file/idx/hash.c File Reference

```
#include "hash.h"
Include dependency graph for hash.c:
```

### **Functions**

int AK\_elem\_hash\_value (struct list\_node \*elem)

Function that computes a hash value from varchar or integer.

• struct\_add \* AK\_insert\_bucket\_to\_block (char \*indexName, char \*data, int type)

Function that inserts a bucket to block.

void AK\_update\_bucket\_in\_block (struct\_add \*add, char \*data)

Function that updates a bucket in block.

• void AK change hash info (char \*indexName, int modulo, int main bucket num, int hash bucket num)

Function that changes a info of hash index.

hash\_info \* AK\_get\_hash\_info (char \*indexName)

Function that fetches the info for hash index.

• struct\_add \* AK\_get\_nth\_main\_bucket\_add (char \*indexName, int n)

Function that fetches nth main bucket.

void AK insert in hash index (char \*indexName, int hashValue, struct add \*add)

Function that inserts a record in hash bucket.

struct add \* AK find delete in hash index (char \*indexName, struct list node \*values, int delete)

Function that fetches or deletes a record from hash index.

• struct\_add \* AK\_find\_in\_hash\_index (char \*indexName, struct list\_node \*values)

Function that fetches a record from the hash index.

void AK\_delete\_in\_hash\_index (char \*indexName, struct list\_node \*values)

Function that deletes a record from the hash index.

• int AK create hash index (char \*tblName, struct list node \*attributes, char \*indexName)

Function that creates a hash index.

- void AK delete hash index (char \*indexName)
- TestResult AK\_hash\_test ()

Function that tests hash index.

## 7.38.1 Detailed Description

Provides functions for Hash indices

## 7.38.2 Function Documentation

### 7.38.2.1 AK\_change\_hash\_info()

Function that changes a info of hash index.

**Author** 

Mislav Čakarić

# **Parameters**

indexName	name of index
modulo	value for modulo hash function
main_bucket_num	number of main buckets
hash_bucket_num	number of hash buckets

## Returns

No return value

# 7.38.2.2 AK\_create\_hash\_index()

Function that creates a hash index.

## Author

Mislav Čakarić

# **Parameters**

tblName	name of table for which the index is being created
indexName	name of index
attributes	list of attributes over which the index is being created

### Returns

success or error

# 7.38.2.3 AK\_delete\_hash\_index()

# 7.38.2.4 AK\_delete\_in\_hash\_index()

Function that deletes a record from the hash index.

**Author** 

Mislav Čakarić

### **Parameters**

indexName	name of index
values	list of values (one row) to search in hash index

### Returns

No return value

# 7.38.2.5 AK\_elem\_hash\_value()

Function that computes a hash value from varchar or integer.

**Author** 

Mislav Čakarić

# Parameters

elem	element of row for wich value is to be computed
------	---

Returns

hash value

# 7.38.2.6 AK\_find\_delete\_in\_hash\_index()

Function that fetches or deletes a record from hash index.

### Author

Mislav Čakarić

#### **Parameters**

indexName	name of index
values	list of values (one row) to search in hash index
delete	if delete is 0 then record is only read otherwise it's deleted from hash index

### Returns

address structure with data where the record is in table

# 7.38.2.7 AK\_find\_in\_hash\_index()

Function that fetches a record from the hash index.

## Author

Mislav Čakarić

## **Parameters**

iı	ndexName	name of index
ν	alues	list of values (one row) to search in hash index

# Returns

address structure with data where the record is in table

# 7.38.2.8 AK\_get\_hash\_info()

Function that fetches the info for hash index.

## Author

Mislav Čakarić

## **Parameters**

indexName	name of index

# Returns

info bucket with info data for hash index

# 7.38.2.9 AK\_get\_nth\_main\_bucket\_add()

Function that fetches nth main bucket.

### **Author**

Mislav Čakarić

## **Parameters**

indexName	name of index
n	number of main bucket

## Returns

address structure with data where the bucket is stored

# 7.38.2.10 AK\_hash\_test()

```
TestResult AK_hash_test ( )
```

Function that tests hash index.

Author

Mislav Čakarić

Returns

No return value

# 7.38.2.11 AK\_insert\_bucket\_to\_block()

Function that inserts a bucket to block.

Author

Mislav Čakarić

#### **Parameters**

indexName	name of index
data	content of bucket stored in char array
type	type of bucket (MAIN_BUCKET or HASH_BUCKET)

## Returns

address structure with data where the bucket is stored

# 7.38.2.12 AK\_insert\_in\_hash\_index()

Function that inserts a record in hash bucket.

Author

Mislav Čakarić

# **Parameters**

indexName	name of index
hashValue	hash value of record that is being inserted
add	address structure with data where the hash bucket is stored

### Returns

No return value

### 7.38.2.13 AK\_update\_bucket\_in\_block()

Function that updates a bucket in block.

Author

Mislav Čakarić

#### **Parameters**

add	address of where the bucket is stored
data	content of bucket stored in char array

### Returns

No return value

# 7.39 file/idx/hash.h File Reference

```
#include "../../auxi/test.h"
#include "index.h"
#include "../../file/table.h"
#include "../../auxi/constants.h"
#include "../../auxi/configuration.h"
#include "../files.h"
#include "../../auxi/mempro.h"
```

Include dependency graph for hash.h: This graph shows which files directly or indirectly include this file:

### **Classes**

· struct hash\_info

Structure for defining a hash info element.

· struct bucket elem

Structure for defining a single bucket element.

· struct main bucket

Structure for defining main bucket for table hashing.

· struct hash\_bucket

Structure for hash bucket for table hashing.

### **Functions**

int AK\_elem\_hash\_value (struct list\_node \*elem)

Function that computes a hash value from varchar or integer.

struct\_add \* AK\_insert\_bucket\_to\_block (char \*indexName, char \*data, int type)

Function that inserts a bucket to block.

void AK\_update\_bucket\_in\_block (struct\_add \*add, char \*data)

Function that updates a bucket in block.

• void AK change hash info (char \*indexName, int modulo, int main bucket num, int hash bucket num)

Function that changes a info of hash index.

hash\_info \* AK\_get\_hash\_info (char \*indexName)

Function that fetches the info for hash index.

• struct\_add \* AK\_get\_nth\_main\_bucket\_add (char \*indexName, int n)

Function that fetches nth main bucket.

void AK insert in hash index (char \*indexName, int hashValue, struct add \*add)

Function that inserts a record in hash bucket.

struct add \* AK find delete in hash index (char \*indexName, struct list node \*values, int delete)

Function that fetches or deletes a record from hash index.

• struct\_add \* AK\_find\_in\_hash\_index (char \*indexName, struct list\_node \*values)

Function that fetches a record from the hash index.

void AK\_delete\_in\_hash\_index (char \*indexName, struct list\_node \*values)

Function that deletes a record from the hash index.

int AK\_create\_hash\_index (char \*tblName, struct list\_node \*attributes, char \*indexName)

Function that creates a hash index.

- void AK delete hash index (char \*indexName)
- TestResult AK\_hash\_test ()

Function that tests hash index.

## 7.39.1 Detailed Description

Header file that provides data structures, functions and defines for Hash indices

## 7.39.2 Function Documentation

### 7.39.2.1 AK\_change\_hash\_info()

Function that changes a info of hash index.

**Author** 

Mislav Čakarić

## **Parameters**

indexName	name of index
modulo	value for modulo hash function
main_bucket_num	number of main buckets
hash_bucket_num	number of hash buckets

## Returns

No return value

# 7.39.2.2 AK\_create\_hash\_index()

Function that creates a hash index.

## Author

Mislav Čakarić

# **Parameters**

tblName	name of table for which the index is being created
indexName	name of index
attributes	list of attributes over which the index is being created

## Returns

success or error

# 7.39.2.3 AK\_delete\_hash\_index()

### 7.39.2.4 AK\_delete\_in\_hash\_index()

Function that deletes a record from the hash index.

**Author** 

Mislav Čakarić

#### **Parameters**

indexName	name of index
values	list of values (one row) to search in hash index

#### Returns

No return value

## 7.39.2.5 AK\_elem\_hash\_value()

Function that computes a hash value from varchar or integer.

**Author** 

Mislav Čakarić

# Parameters

```
elem element of row for wich value is to be computed
```

Returns

hash value

## 7.39.2.6 AK\_find\_delete\_in\_hash\_index()

Function that fetches or deletes a record from hash index.

#### Author

Mislav Čakarić

#### **Parameters**

indexName	name of index
values	list of values (one row) to search in hash index
delete	if delete is 0 then record is only read otherwise it's deleted from hash index

#### Returns

address structure with data where the record is in table

# 7.39.2.7 AK\_find\_in\_hash\_index()

Function that fetches a record from the hash index.

## Author

Mislav Čakarić

## **Parameters**

indexName	name of index
values	list of values (one row) to search in hash index

## Returns

address structure with data where the record is in table

# 7.39.2.8 AK\_get\_hash\_info()

Function that fetches the info for hash index.

### Author

Mislav Čakarić

#### **Parameters**

indexName   name of index
---------------------------

## Returns

info bucket with info data for hash index

# 7.39.2.9 AK\_get\_nth\_main\_bucket\_add()

Function that fetches nth main bucket.

#### **Author**

Mislav Čakarić

### **Parameters**

indexName	name of index
n	number of main bucket

## Returns

address structure with data where the bucket is stored

# 7.39.2.10 AK\_hash\_test()

```
TestResult AK_hash_test ( )
```

Function that tests hash index.

## Author

Mislav Čakarić

## Returns

# 7.39.2.11 AK\_insert\_bucket\_to\_block()

Function that inserts a bucket to block.

Author

Mislav Čakarić

#### **Parameters**

indexName	name of index
data	content of bucket stored in char array
type	type of bucket (MAIN_BUCKET or HASH_BUCKET)

### Returns

address structure with data where the bucket is stored

## 7.39.2.12 AK\_insert\_in\_hash\_index()

Function that inserts a record in hash bucket.

Author

Mislav Čakarić

## **Parameters**

indexName	name of index
hashValue	hash value of record that is being inserted
add	address structure with data where the hash bucket is stored

#### Returns

#### 7.39.2.13 AK\_update\_bucket\_in\_block()

Function that updates a bucket in block.

**Author** 

Mislav Čakarić

#### **Parameters**

add	address of where the bucket is stored
data	content of bucket stored in char array

Returns

No return value

## 7.40 file/idx/index.c File Reference

```
#include "index.h"
#include <stdlib.h>
#include "../../auxi/mempro.h"
#include "../../file/table.h"
#include "../../file/fileio.h"
#include dependency graph for index.c:
```

#### **Functions**

void AK\_InitializelistAd (list\_ad \*L)

Function that initialises a linked list.

• element ad AK Get First elementAd (list ad \*L)

Function that finds the first node of linked list.

element\_ad AK\_Get\_Last\_elementAd (list\_ad \*L)

Function that finds the last node of linked list.

• element ad AK Get Next elementAd (element ad Currentelement op)

Function that finds the next node of a node in linked list.

element\_ad AK\_Get\_Previous\_elementAd (element\_ad Currentelement\_op, element\_ad L)

Function that finds the previous node of a node in linked list.

int AK\_Get\_Position\_Of\_elementAd (element\_ad Searchedelement\_op, list\_ad \*L)

Function that finds the position of a node in linked list.

• void AK\_Delete\_elementAd (element\_ad Deletedelement\_op, list\_ad \*L)

Function that deletes a node from a linked list.

void AK\_Delete\_All\_elementsAd (list\_ad \*L)

Function that deletes all nodes in a linked list.

• void AK\_Insert\_NewelementAd (int addBlock, int indexTd, char \*attName, element\_ad elementBefore)

Function that inserts a new element into a linked list.

int AK\_num\_index\_attr (char \*indexTblName)

Function that fetches the number of elements in a index table.

int AK\_get\_index\_num\_records (char \*indexTblName)

Determine number of rows in the table.

• struct list\_node \* AK\_get\_index\_tuple (int row, int column, char \*indexTblName)

Function that gets value in some row and column.

int AK\_index\_table\_exist (char \*indexTblName)

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

AK\_header \* AK\_get\_index\_header (char \*indexTblName)

Function that gets index table header.

void AK\_print\_index\_table (char \*indexTblName)

Function that prints out the index table.

void AK\_index\_test ()

Test funtion for index structures(list) and printing table.

## 7.40.1 Detailed Description

Provides functions for indexes

### 7.40.2 Function Documentation

## 7.40.2.1 AK\_Delete\_All\_elementsAd()

```
void AK_Delete_All_elementsAd ( \label{eq:list_ad} \mbox{list\_ad} \ * \ L \ )
```

Function that deletes all nodes in a linked list.

**Author** 

Unknown

**Parameters** 

L list head

Returns

## 7.40.2.2 AK\_Delete\_elementAd()

Function that deletes a node from a linked list.

**Author** 

Unknown

#### **Parameters**

Deletedelement_op	- address of node to delete
list_ad	*L - list head

#### Returns

No return value

## 7.40.2.3 AK\_Get\_First\_elementAd()

Function that finds the first node of linked list.

**Author** 

Unknown

### **Parameters**

```
list_ad *L linked list head
```

Returns

Address of first node

# 7.40.2.4 AK\_get\_index\_header()

Function that gets index table header.

#### Author

Matija Šestak, modified for indexes by Lovro Predovan

- 1. Read addresses of extents
- 2. If there is no extents in the table, return -1
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

#### **Parameters**

```
*tblName | table name
```

### Returns

array of table header

## 7.40.2.5 AK\_get\_index\_num\_records()

Determine number of rows in the table.

### **Author**

Matija Šestak, modified for indexes by Lovro Predovan

- 1. Read addresses of extents
- 2. If there is no extents in the table, return -1
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

### **Parameters**

*tableName   table name
-------------------------

#### Returns

number of rows in the table

## 7.40.2.6 AK\_get\_index\_tuple()

Function that gets value in some row and column.

#### **Author**

Matija Šestak, modified for indexes by Lovro Predovan

#### **Parameters**

row	zero-based row index
column	zero-based column index
*tblName	table name

#### Returns

value in the list

## 7.40.2.7 AK\_Get\_Last\_elementAd()

```
\begin{tabular}{ll} \tt element\_ad & AK\_Get\_Last\_elementAd & ( & \\ & list\_ad * L & ) \end{tabular}
```

Function that finds the last node of linked list.

## Author

Unknown

## **Parameters**

```
list_ad *L linked list head
```

# Returns

Address of last node or 0 if list is empty

## 7.40.2.8 AK\_Get\_Next\_elementAd()

Function that finds the next node of a node in linked list.

#### Author

Unknown

#### **Parameters**

#### Returns

Address of next node or 0 if current node is last in list

## 7.40.2.9 AK\_Get\_Position\_Of\_elementAd()

Function that finds the position of a node in linked list.

## Author

Unknown

## **Parameters**

Searchedelement_op	address of current note
*L	linked list head

### Returns

Integer value of current node's order in the list

# 7.40.2.10 AK\_Get\_Previous\_elementAd()

Function that finds the previous node of a node in linked list.

## Author

Unknown

#### **Parameters**

Currentelement_op	Address of current node
L	previous element

#### Returns

Address of previous node or 0 if the current node is the head or the list is empty

## 7.40.2.11 AK\_index\_table\_exist()

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

### **Author**

Matija Šestak, modified for indexes by Lovro Predovan

#### **Parameters**

tblName	table name
---------	------------

#### Returns

returns 1 if table exist or returns 0 if table does not exist

### 7.40.2.12 AK\_index\_test()

```
void AK_index_test ( )
```

Test funtion for index structures(list) and printing table.

## Author

Lovro Predovan

## Returns

# 7.40.2.13 AK\_InitializelistAd()

```
void AK_InitializelistAd ( {\tt list\_ad * L } )
```

Function that initialises a linked list.

Author

Unknown

### **Parameters**

## Returns

No return value

# 7.40.2.14 AK\_Insert\_NewelementAd()

Function that inserts a new element into a linked list.

Author

Unknown

#### **Parameters**

addBlock	address block
indexTd	index table destination
*attname	attribute name
elementBefore	address of the node after which the new node will be inserted

#### Returns

### 7.40.2.15 AK\_num\_index\_attr()

Function that fetches the number of elements in a index table.

**Author** 

Lovro Predovan

#### **Parameters**

#### **Returns**

No return value

### 7.40.2.16 AK\_print\_index\_table()

Function that prints out the index table.

Author

Matija Šestak, modified for indexes by Lovro Predovan

### **Parameters**

```
*tblName | table name
```

Returns

No return value

# 7.41 file/idx/index.h File Reference

```
#include "../../auxi/mempro.h"
#include "../../file/table.h"
#include "../../file/fileio.h"
#include "../../file/files.h"
```

Include dependency graph for index.h: This graph shows which files directly or indirectly include this file:

#### **Classes**

struct struct\_add

Structure defining node address.

· struct list\_structure\_ad

## **Typedefs**

- · typedef struct list structure ad list structure ad
- typedef list\_structure\_ad \* element\_ad
- · typedef list\_structure\_ad list\_ad

#### **Functions**

• int AK\_index\_table\_exist (char \*indexTblName)

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

void AK print index table (char \*indexTblName)

Function that prints out the index table.

struct list node \* AK get index tuple (int row, int column, char \*indexTblName)

Function that gets value in some row and column.

int AK get index num records (char \*indexTblName)

Determine number of rows in the table.

int AK\_num\_index\_attr (char \*indexTblName)

Function that fetches the number of elements in a index table.

void AK\_InitializelistAd (list\_ad \*L)

Function that initialises a linked list.

element\_ad AK\_Get\_First\_elementAd (list\_ad \*L)

Function that finds the first node of linked list.

element\_ad AK\_Get\_Last\_elementAd (list\_ad \*L)

Function that finds the last node of linked list.

element\_ad AK\_Get\_Next\_elementAd (element\_ad Currentelement\_op)

Function that finds the next node of a node in linked list.

• element\_ad AK\_Get\_Previous\_elementAd (element\_ad Currentelement\_op, element\_ad L)

Function that finds the previous node of a node in linked list.

• int AK\_Get\_Position\_Of\_elementAd (element\_ad Searchedelement\_op, list\_ad \*L)

Function that finds the position of a node in linked list.

 $\bullet \ \ void \ AK\_Delete\_elementAd \ (element\_ad \ Deletedelement\_op, \ list\_ad \ *L)\\$ 

Function that deletes a node from a linked list.

void AK\_Delete\_All\_elementsAd (list\_ad \*L)

Function that deletes all nodes in a linked list.

• void AK\_Insert\_NewelementAd (int addBlock, int indexTd, char \*attName, element\_ad elementBefore)

Function that inserts a new element into a linked list.

void AK\_index\_test ()

Test funtion for index structures(list) and printing table.

## 7.41.1 Detailed Description

Header file that provides data structures, functions and defines for bitmap index

# 7.41.2 Typedef Documentation

## 7.41.2.1 element\_ad

```
typedef list_structure_ad* element_ad
```

# 7.41.2.2 list\_ad

```
typedef list_structure_ad list_ad
```

## 7.41.2.3 list\_structure\_ad

```
typedef struct list_structure_ad list_structure_ad
```

# 7.41.3 Function Documentation

# 7.41.3.1 AK\_Delete\_All\_elementsAd()

```
void AK_Delete_All_elementsAd ( \label{eq:list_ad} \mbox{list\_ad} \ * \ L \ )
```

Function that deletes all nodes in a linked list.

Author

Unknown

## **Parameters**

### Returns

## 7.41.3.2 AK\_Delete\_elementAd()

Function that deletes a node from a linked list.

**Author** 

Unknown

#### **Parameters**

Deletedelement_op	- address of node to delete
list_ad	*L - list head

### Returns

No return value

# 7.41.3.3 AK\_Get\_First\_elementAd()

Function that finds the first node of linked list.

**Author** 

Unknown

### **Parameters**

list_ad	*L linked list head
---------	---------------------

**Returns** 

Address of first node

## 7.41.3.4 AK\_get\_index\_num\_records()

Determine number of rows in the table.

#### Author

Matija Šestak, modified for indexes by Lovro Predovan

- 1. Read addresses of extents
- 2. If there is no extents in the table, return -1
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

### **Parameters**

. +=  -  -   A	talala mama
*tableName	table name

#### Returns

number of rows in the table

## 7.41.3.5 AK\_get\_index\_tuple()

Function that gets value in some row and column.

#### **Author**

Matija Šestak, modified for indexes by Lovro Predovan

## Parameters

row	zero-based row index	
column	zero-based column index	
*tblName	table name	

### Returns

value in the list

## 7.41.3.6 AK\_Get\_Last\_elementAd()

```
\begin{tabular}{ll} element\_ad & AK\_Get\_Last\_elementAd & \\ & list\_ad * L \end{tabular} \label{list_ad}
```

Function that finds the last node of linked list.

**Author** 

Unknown

#### **Parameters**

```
list_ad *L linked list head
```

#### Returns

Address of last node or 0 if list is empty

## 7.41.3.7 AK\_Get\_Next\_elementAd()

Function that finds the next node of a node in linked list.

**Author** 

Unknown

**Parameters** 

Currentelement_op	address of current node
-------------------	-------------------------

## Returns

Address of next node or 0 if current node is last in list

## 7.41.3.8 AK\_Get\_Position\_Of\_elementAd()

Function that finds the position of a node in linked list.

#### Author

Unknown

#### **Parameters**

Searchedelement_op	address of current note
*L	linked list head

#### Returns

Integer value of current node's order in the list

## 7.41.3.9 AK\_Get\_Previous\_elementAd()

Function that finds the previous node of a node in linked list.

#### Author

Unknown

## **Parameters**

Currentelement_op	Address of current node
L	previous element

#### Returns

Address of previous node or 0 if the current node is the head or the list is empty

# 7.41.3.10 AK\_index\_table\_exist()

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

### Author

Matija Šestak, modified for indexes by Lovro Predovan

### **Parameters**

tblName	table name
---------	------------

### Returns

returns 1 if table exist or returns 0 if table does not exist

# 7.41.3.11 AK\_index\_test()

```
void AK_index_test ( )
```

Test funtion for index structures(list) and printing table.

**Author** 

Lovro Predovan

Returns

No return value

## 7.41.3.12 AK\_InitializelistAd()

Function that initialises a linked list.

Author

Unknown

### **Parameters**

```
list_ad *L linked list head
```

#### Returns

## 7.41.3.13 AK\_Insert\_NewelementAd()

Function that inserts a new element into a linked list.

**Author** 

Unknown

#### **Parameters**

addBlock	address block
indexTd	index table destination
*attname	attribute name
elementBefore	address of the node after which the new node will be inserted

### Returns

No return value

# 7.41.3.14 AK\_num\_index\_attr()

Function that fetches the number of elements in a index table.

Author

Lovro Predovan

#### **Parameters**

index	table name

Returns

## 7.41.3.15 AK\_print\_index\_table()

Function that prints out the index table.

**Author** 

Matija Šestak, modified for indexes by Lovro Predovan

#### **Parameters**

```
*tblName table name
```

Returns

No return value

# 7.42 file/sequence.c File Reference

```
#include "sequence.h"
Include dependency graph for sequence.c:
```

### **Functions**

- int AK\_sequence\_add (char \*name, int start\_value, int increment, int max\_value, int min\_value, int cycle)

  Function for adding sequence.
- int AK\_sequence\_remove (char \*name)

Function for removing sequence.

• int AK\_sequence\_current\_value (char \*name)

Function that returns the current value of the sequence.

int AK\_sequence\_next\_value (char \*name)

Function that returns the next value of the sequence and writes it in a system table as current value.

int AK\_sequence\_get\_id (char \*name)

Function that fetches sequence id.

int AK\_sequence\_rename (char \*old\_name, char \*new\_name)

Function that renames the sequence.

- int AK\_sequence\_modify (char \*name, int start\_value, int increment, int max\_value, int min\_value, int cycle)

  Function for modifying a sequence.
- TestResult AK\_sequence\_test ()

Function used for sequences testing.

# 7.42.1 Detailed Description

Provides functions for sequences

## 7.42.2 Function Documentation

# 7.42.2.1 AK\_sequence\_add()

Function for adding sequence.

Author

Boris Kišić

#### **Parameters**

name	name of the sequence
start_value	start value of the sequence
increment	increment of the sequence
max_value	maximium value of the sequence
min_value	minimum value of the sequence
cycle	0:non-cyclic sequence, 1:cyclic sequence

## Returns

sequence\_id or EXIT\_ERROR

## 7.42.2.2 AK\_sequence\_current\_value()

Function that returns the current value of the sequence.

Author

Boris Kišić

#### **Parameters**

name name of the sequence
---------------------------

### Returns

current\_value or EXIT\_ERROR

## 7.42.2.3 AK\_sequence\_get\_id()

Function that fetches sequence id.

Author

Ljubo Barać

### **Parameters**

name	Name of the sequence
------	----------------------

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.42.2.4 AK\_sequence\_modify()

Function for modifying a sequence.

Author

Boris Kišić fixed by Ljubo Barać

### **Parameters**

name	Name of the sequence
start_value	start value of the sequence
increment	increment of the sequence
max_value	maximium value of the sequence
min_value	minimum value of the sequence
cycle	0:non-cyclic sequence, 1:cyclic sequence

Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.42.2.5 AK\_sequence\_next\_value()

Function that returns the next value of the sequence and writes it in a system table as current value.

Author

Boris Kišić

#### **Parameters**

name name of the sequence	Э
---------------------------	---

### Returns

next\_value or EXIT\_ERROR

## 7.42.2.6 AK\_sequence\_remove()

```
int AK_sequence_remove ( {\tt char} \ * \ {\tt name} \ )
```

Function for removing sequence.

Author

Boris Kišić

## Parameters

name name of the sequence

Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.42.2.7 AK\_sequence\_rename()

Function that renames the sequence.

Author

Boris Kišić

#### **Parameters**

old_name	Name of the sequence to be renamed
new_name	New name of the sequence

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.42.2.8 AK\_sequence\_test()

```
TestResult AK_sequence_test ( )
```

Function used for sequences testing.

**Author** 

Boris Kišić fixed by Ljubo Barać

Returns

No return value

# 7.43 file/sequence.h File Reference

```
#include "../auxi/test.h"
#include "table.h"
#include "id.h"
#include "fileio.h"
#include "../auxi/mempro.h"
```

Include dependency graph for sequence.h: This graph shows which files directly or indirectly include this file:

### **Functions**

- int AK\_sequence\_add (char \*name, int start\_value, int increment, int max\_value, int min\_value, int cycle)

  Function for adding sequence.
- int AK\_sequence\_remove (char \*name)

Function for removing sequence.

• int AK\_sequence\_current\_value (char \*name)

Function that returns the current value of the sequence.

int AK\_sequence\_next\_value (char \*name)

Function that returns the next value of the sequence and writes it in a system table as current value.

• int AK\_sequence\_rename (char \*old\_name, char \*new\_name)

Function that renames the sequence.

- int AK\_sequence\_modify (char \*name, int start\_value, int increment, int max\_value, int min\_value, int cycle) Function for modifying a sequence.
- int AK\_sequence\_get\_id (char \*name)

Function that fetches sequence id.

TestResult AK\_sequence\_test ()

Function used for sequences testing.

# 7.43.1 Detailed Description

Header file that provides functions and defines for sequences

#### 7.43.2 Function Documentation

### 7.43.2.1 AK\_sequence\_add()

Function for adding sequence.

**Author** 

Boris Kišić

### **Parameters**

name	name of the sequence
start_value	start value of the sequence
increment	increment of the sequence
max_value	maximium value of the sequence
min_value Generated by Doxy	minimum value of the sequence
cycle	0:non-cyclic sequence, 1:cyclic sequence

#### Returns

sequence\_id or EXIT\_ERROR

# 7.43.2.2 AK\_sequence\_current\_value()

Function that returns the current value of the sequence.

Author

Boris Kišić

#### **Parameters**

name	name of the sequence
------	----------------------

### Returns

current\_value or EXIT\_ERROR

# 7.43.2.3 AK\_sequence\_get\_id()

Function that fetches sequence id.

**Author** 

Ljubo Barać

### **Parameters**

name Name of the sequence

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

### 7.43.2.4 AK\_sequence\_modify()

Function for modifying a sequence.

**Author** 

Boris Kišić fixed by Ljubo Barać

#### **Parameters**

name	Name of the sequence
start_value	start value of the sequence
increment	increment of the sequence
max_value	maximium value of the sequence
min_value	minimum value of the sequence
cycle	0:non-cyclic sequence, 1:cyclic sequence

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.43.2.5 AK\_sequence\_next\_value()

Function that returns the next value of the sequence and writes it in a system table as current value.

Author

Boris Kišić

### **Parameters**

name	name of the sequence
------	----------------------

## Returns

next\_value or EXIT\_ERROR

## 7.43.2.6 AK\_sequence\_remove()

Function for removing sequence.

Author

Boris Kišić

### **Parameters**

name	name of the sequence
name	name of the sequence

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.43.2.7 AK\_sequence\_rename()

Function that renames the sequence.

/\*\*

Author

Boris Kišić

## **Parameters**

old_name	Name of the sequence to be renamed
new_name	New name of the sequence

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

Author

Boris Kišić

#### **Parameters**

old_name	Name of the sequence to be renamed
new_name	New name of the sequence

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

#### 7.43.2.8 AK\_sequence\_test()

```
TestResult AK_sequence_test ( )
```

Function used for sequences testing.

**Author** 

Boris Kišić fixed by Ljubo Barać

Returns

No return value

# 7.44 file/table.c File Reference

```
#include "../file/table.h"
Include dependency graph for table.c:
```

### **Functions**

- $\bullet \ \ \mathsf{AK\_create\_table\_parameter} * \ \mathsf{AK\_create\_table\_parameter} (\mathsf{int} \ \mathsf{type}, \ \mathsf{char} \ * \mathsf{name})$ 
  - Constructs a table parameter struct object.
- void AK\_create\_table (char \*tblName, AK\_create\_table\_parameter \*parameters, int attribute\_count)
   Creates a table.
- void AK\_temp\_create\_table (char \*table, AK\_header \*header, int type\_segment)
  - Temporary function that creates table, and inserts an entry to the system\_relation catalog.
- int AK\_num\_attr (char \*tblName)

Functions that determines the number of attributes in the table.

• int AK get num records (char \*tblName)

Function that determines the number of rows in the table.

AK\_header \* AK\_get\_header (char \*tblName)

Function that fetches the table header.

char \* AK get attr name (char \*tblName, int index)

Function that fetches attribute name for some zero-based index.

int AK\_get\_attr\_index (char \*tblName, char \*attrName)

Function that fetches zero-based index for attribute.

struct list\_node \* AK\_get\_column (int num, char \*tblName)

Function that fetches all values in some column and put on the list.

struct list node \* AK get row (int num, char \*tblName)

Function that fetches all values in some row and put on the list.

struct list\_node \* AK\_find\_tuple (int row, int column, int num\_attr, table\_addresses \*addresses, struct list\_node \*row\_root)

Function that finds the tuple in memory.

struct list node \* AK get tuple (int row, int column, char \*tblName)

Function that fetches a value in some row and column.

char \* AK\_tuple\_to\_string (struct list\_node \*tuple)

Function that converts tuple value to string.

void AK\_print\_row\_spacer (int col\_len[], int length)

Function that prints row spacer.

• void AK\_print\_row (int col\_len[], struct list\_node \*row)

Function that prints table row.

• int AK\_table\_exist (char \*tblName)

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

void AK\_print\_table (char \*tblName)

Function for printing table.

void AK\_print\_row\_spacer\_to\_file (int col\_len[], int length)

Function that prints row spacer update by Luka Rajcevic.

char \* get row attr data (int column, struct list node \*node)

Function that returns the value of an attribute from the row.

void AK\_print\_row\_to\_file (int col\_len[], struct list\_node \*row)

Function that prints the table row update by Luka Rajcevic.

void AK\_print\_table\_to\_file (char \*tblName)

Function that prints a table.

• int AK\_table\_empty (char \*tblName)

Function that checks whether the table is empty.

int AK\_get\_table\_obj\_id (char \*table)

Function that fetches an obj\_id of named table from AK\_relation system table.

 int AK\_check\_tables\_scheme (AK\_mem\_block \*tbl1\_temp\_block, AK\_mem\_block \*tbl2\_temp\_block, char \*operator\_name)

Function that checks if tables have the same relation schema.

• int AK\_rename (char \*old\_table\_name, char \*old\_attr, char \*new\_table\_name, char \*new\_attr)

Function for renaming table and/or attribute in table (moved from rename.c)

• TestResult AK table test ()

Function for testing table abstraction.

TestResult AK\_op\_rename\_test ()

Function for renaming operator testing (moved from rename.c)

### 7.44.1 Detailed Description

Provides functions for table abstraction

### 7.44.2 Function Documentation

# 7.44.2.1 AK\_check\_tables\_scheme()

Function that checks if tables have the same relation schema.

#### **Author**

Dino Laktašić, abstracted from difference.c for use in difference.c, intersect.c and union.c by Tomislav Mikulček

#### **Parameters**

tbl1_temp_block	first cache block of the first table
tbl2_temp_block	first cache block of the second table
operator_name	the name of operator, used for displaying error message

### Returns

if success returns num of attributes in schema, else returns EXIT\_ERROR

# 7.44.2.2 AK\_create\_create\_table\_parameter()

Constructs a table parameter struct object.

### Author

Unknown

### **Parameters**

type	parameter type
name	parameter name

### Returns

A pointer to the constructed AK\_create\_table\_parameter object

## 7.44.2.3 AK\_create\_table()

Creates a table.

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

#### **Author**

Unknown, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

tblName	the name of the table	
parameters	table parameters array (each parameter contains name and type)	
attribute_count	the amount of attributes	

### Returns

No return value

## 7.44.2.4 AK\_find\_tuple()

```
struct list_node* AK_find_tuple (
    int row,
    int column,
    int num_attr,
    table_addresses * addresses,
    struct list_node * row_root )
```

Function that finds the tuple in memory.

## Author

Barbara Tatai, updated by Josip Šušnjara (chained blocks support)

### **Parameters**

row	zero-based row index
column	zero-based column index
num_attr	the number of attributes in the table
addresses	table addresses
row_root	the root node of the list of rows

#### Returns

a pointer to a list\_node representing the element tuple

## 7.44.2.5 AK\_get\_attr\_index()

Function that fetches zero-based index for atrribute.

**Author** 

Matija Šestak.

#### **Parameters**

*tblName	table name
*attrName	attribute name

#### Returns

zero-based index

# 7.44.2.6 AK\_get\_attr\_name()

Function that fetches attribute name for some zero-based index.

Author

Matija Šestak

## **Parameters**

*tblName	table name
index	zero-based index

## Returns

attribute name

# 7.44.2.7 AK\_get\_column()

Function that fetches all values in some column and put on the list.

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

num	zero-based column index
*tblName	table name

#### Returns

column values list

### 7.44.2.8 AK\_get\_header()

Function that fetches the table header.

### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return 0
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

#### **Parameters**

*tblName	table name

#### Returns

array of table header

## 7.44.2.9 AK\_get\_num\_records()

Function that determines the number of rows in the table.

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

### **Parameters**

```
*tableName | table name
```

# Returns

number of rows in the table

## 7.44.2.10 AK\_get\_row()

Function that fetches all values in some row and put on the list.

#### **Author**

Markus Schatten, Matija Šestak.

## **Parameters**

num	zero-based row index
*	tblName table name

#### Returns

row values list

# 7.44.2.11 AK\_get\_table\_obj\_id()

Function that fetches an obj\_id of named table from AK\_relation system table.

Author

Dejan Frankovic

#### **Parameters**

*table   table name
---------------------

### Returns

obj\_id of the table or EXIT\_ERROR if there is no table with that name

# 7.44.2.12 AK\_get\_tuple()

```
struct list_node* AK_get_tuple (
    int row,
    int column,
    char * tblName )
```

Function that fetches a value in some row and column.

Author

Matija Šestak

row	zero-based row index
column	zero-based column index
*tblName	table name

#### Returns

value in the list

## 7.44.2.13 AK\_num\_attr()

Functions that determines the number of attributes in the table.

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. else read the first block
- 4. while header tuple exists in the block, increment num\_attr

#### **Parameters**

\* tblName table name

#### Returns

number of attributes in the table

## 7.44.2.14 AK\_op\_rename\_test()

```
TestResult AK_op_rename_test ( )
```

Function for renaming operator testing (moved from rename.c)

### Author

Mislav Čakarić, edited by Ljubo Barać

## Returns

TestResult containing information on the amount of failed/passed tests

# 7.44.2.15 AK\_print\_row()

```
void AK_print_row (
          int col_len[],
          struct list_node * row )
```

Function that prints table row.

**Author** 

Dino Laktašić

#### **Parameters**

col_len[]	array of max lengths for each attribute	
*row	list with row elements	

## Returns

No return value

# 7.44.2.16 AK\_print\_row\_spacer()

```
void AK_print_row_spacer (
          int col_len[],
          int length )
```

Function that prints row spacer.

**Author** 

Dino Laktašić.

## **Parameters**

col_len[]	max lengths for each attribute cell
length	total table width

#### Returns

printed row spacer

# 7.44.2.17 AK\_print\_row\_spacer\_to\_file()

Function that prints row spacer update by Luka Rajcevic.

**Author** 

Dino Laktašić.

#### **Parameters**

col_len[]	max lengths for each attribute cell	
length	total table width	

#### Returns

printed row spacer

# 7.44.2.18 AK\_print\_row\_to\_file()

```
void AK_print_row_to_file (
    int col_len[],
    struct list_node * row )
```

Function that prints the table row update by Luka Rajcevic.

**Author** 

Dino Laktašić

## Parameters

col_len[]	array of max lengths for each attribute	
*row	list with row elements	

#### Returns

No return value

## 7.44.2.19 AK\_print\_table()

Function for printing table.

**Author** 

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one), updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

*tblName	table name
* <i>lbiiname</i>	table name

#### Returns

No return value

## 7.44.2.20 AK\_print\_table\_to\_file()

Function that prints a table.

## Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one), updated by Josip Šušnjara (chained blocks support) update by Luka Rajcevic

#### **Parameters**

```
*tblName table name
```

# Returns

No return value update by Anto Tomaš (corrected the AK\_DeleteAll\_L3 function)

## 7.44.2.21 AK rename()

Function for renaming table and/or attribute in table (moved from rename.c)

## **Author**

Mislav Čakarić edited by Ljubo Barać

#### **Parameters**

old_table_name	old name of the table
new_table_name	new name of the table
old_attr	name of the attribute to rename
new_attr	new name for the attribute to rename

#### Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.44.2.22 AK\_table\_empty()

Function that checks whether the table is empty.

**Author** 

Matija Šestak.

## **Parameters**

*tblName 1	table name
------------	------------

## Returns

true/false

## 7.44.2.23 AK\_table\_exist()

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

Author

Jurica Hlevnjak

#### Returns

returns 1 if table exist or returns 0 if table does not exist

## 7.44.2.24 AK\_table\_test()

```
TestResult AK_table_test ( )
```

Function for testing table abstraction.

**Author** 

Matija Šestak

## Returns

TestResult containing information on the amount of failed/passed tests

@update by Ana-Marija Balen - added getRow function to the test @update by Barbara Tatai - fixed SIGSEGV (caused by storing char pointers into integers), fixed successful/failed counter

## 7.44.2.25 AK\_temp\_create\_table()

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

## Author

Matija Novak, updated by Dino Laktašić

#### **Parameters**

table	table name
header	AK_header of the new table
type_segment	type of the new segment

## Returns

No return value

## 7.44.2.26 AK\_tuple\_to\_string()

Function that converts tuple value to string.

**Author** 

Matija Šestak.

#### **Parameters**

*tuple	tuple in the list
--------	-------------------

#### Returns

tuple value as a string

## 7.44.2.27 get\_row\_attr\_data()

Function that returns the value of an attribute from the row.

**Author** 

Leon Palaić

#### **Parameters**

column	index of column atribute
*row	list with row elements

Returns

atribute data

# 7.45 file/table.h File Reference

```
#include "../mm/memoman.h"
```

Include dependency graph for table.h: This graph shows which files directly or indirectly include this file:

#### **Classes**

struct AK\_create\_table\_struct

#### **Macros**

• #define TABLE

## **Typedefs**

typedef struct AK\_create\_table\_struct AK\_create\_table\_parameter

#### **Functions**

• AK\_create\_table\_parameter \* AK\_create\_table\_parameter (int type, char \*name)

Constructs a table parameter struct object.

void AK\_create\_table (char \*tblName, AK\_create\_table\_parameter \*parameters, int attribute\_count)

Temporary function that creates table, and inserts an entry to the system relation catalog.

void AK\_temp\_create\_table (char \*table, AK\_header \*header, int type\_segment)

Temporary function that creates table, and inserts an entry to the system relation catalog.

int AK\_num\_attr (char \*tblName)

Functions that determines the number of attributes in the table.

int AK\_get\_num\_records (char \*tblName)

Function that determines the number of rows in the table.

• AK\_header \* AK\_get\_header (char \*tblName)

Function that fetches the table header.

char \* AK\_get\_attr\_name (char \*tblName, int index)

Function that fetches attribute name for some zero-based index.

• int AK get attr index (char \*tblName, char \*attrName)

Function that fetches zero-based index for attribute.

struct list\_node \* AK\_get\_column (int num, char \*tblName)

Function that fetches all values in some column and put on the list.

struct list\_node \* AK\_get\_row (int num, char \*tblName)

Function that fetches all values in some row and put on the list.

struct list\_node \* AK\_get\_tuple (int row, int column, char \*tblName)

Function that fetches a value in some row and column.

char \* AK\_tuple\_to\_string (struct list\_node \*tuple)

Function that converts tuple value to string.

void AK\_print\_row\_spacer (int col\_len[], int length)

Function that prints row spacer.

void AK\_print\_row (int col\_len[], struct list\_node \*row)

Function that prints table row.

void AK print table (char \*tblName)

Function for printing table.

void AK\_print\_row\_spacer\_to\_file (int col\_len[], int length)

Function that prints row spacer update by Luka Rajcevic.

void AK print row to file (int col len[], struct list node \*row)

Function that prints the table row update by Luka Rajcevic.

void AK\_print\_table\_to\_file (char \*tblName)

Function that prints a table.

int AK\_table\_empty (char \*tblName)

Function that checks whether the table is empty.

int AK\_get\_table\_obj\_id (char \*table)

Function that fetches an obj\_id of named table from AK\_relation system table.

 int AK\_check\_tables\_scheme (AK\_mem\_block \*tbl1\_temp\_block, AK\_mem\_block \*tbl2\_temp\_block, char \*operator\_name)

Function that checks if tables have the same relation schema.

char \* get row attr data (int column, struct list node \*node)

Function that returns the value of an attribute from the row.

• TestResult AK table test ()

Function for testing table abstraction.

int AK\_rename (char \*old\_table\_name, char \*old\_attr, char \*new\_table\_name, char \*new\_attr)

Function for renaming table and/or attribute in table (moved from rename.c)

TestResult AK\_op\_rename\_test ()

Function for renaming operator testing (moved from rename.c)

# 7.45.1 Detailed Description

Header file that provides data structures, functions and defines for table abstraction

## 7.45.2 Macro Definition Documentation

# 7.45.2.1 TABLE

#define TABLE

### 7.45.3 Typedef Documentation

### 7.45.3.1 AK\_create\_table\_parameter

typedef struct AK\_create\_table\_struct AK\_create\_table\_parameter

## 7.45.4 Function Documentation

## 7.45.4.1 AK\_check\_tables\_scheme()

Function that checks if tables have the same relation schema.

#### **Author**

Dino Laktašić, abstracted from difference.c for use in difference.c, intersect.c and union.c by Tomislav Mikulček

#### **Parameters**

tbl1_temp_block	first cache block of the first table
tbl2_temp_block	first cache block of the second table
operator_name	the name of operator, used for displaying error message

## Returns

if success returns num of attributes in schema, else returns EXIT\_ERROR

## 7.45.4.2 AK\_create\_create\_table\_parameter()

Constructs a table parameter struct object.

## Author

Unknown

type	parameter type
name	parameter name

#### Returns

A pointer to the constructed AK\_create\_table\_parameter object

## 7.45.4.3 AK\_create\_table()

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

#### **Author**

Matija Novak, updated by Dino Laktašić

#### **Parameters**

table	table name
header	AK_header of the new table
type_segment	type of the new segment

#### Returns

No return value

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

## Author

Unknown, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

tblName	the name of the table
parameters	table parameters array (each parameter contains name and type)
attribute_count	the amount of attributes

#### Returns

No return value

# 7.45.4.4 AK\_get\_attr\_index()

Function that fetches zero-based index for atrribute.

**Author** 

Matija Šestak.

## **Parameters**

*tblName	table name
*attrName	attribute name

## Returns

zero-based index

# 7.45.4.5 AK\_get\_attr\_name()

Function that fetches attribute name for some zero-based index.

Author

Matija Šestak.

## **Parameters**

*tblName	table name
index	zero-based index

Returns

attribute name

Author

Matija Šestak

## **Parameters**

*tblName	table name
index	zero-based index

#### Returns

attribute name

# 7.45.4.6 AK\_get\_column()

Function that fetches all values in some column and put on the list.

#### **Author**

Matija Šestak.

## **Parameters**

num	zero-based column index
*tblName	table name

## Returns

column values list

## Author

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

num	zero-based column index
*tblName	table name

## Returns

column values list

## 7.45.4.7 AK\_get\_header()

Function that fetches the table header.

#### **Author**

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return 0
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

#### **Parameters**

```
*tblName table name
```

#### Returns

array of table header

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return 0
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

### **Parameters**

```
*tblName table name
```

### Returns

array of table header

## 7.45.4.8 AK\_get\_num\_records()

Function that determines the number of rows in the table.

#### Author

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

#### **Parameters**

ı		
ı	*tableName	table name
ı	* labici vaiiic	table Hallie

#### Returns

number of rows in the table

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

#### **Parameters**

```
*tableName | table name
```

## Returns

number of rows in the table

## 7.45.4.9 AK\_get\_row()

Function that fetches all values in some row and put on the list.

#### Author

Markus Schatten, Matija Šestak.

#### **Parameters**

num	zero-based row index
*	tblName table name

#### Returns

row values list

# 7.45.4.10 AK\_get\_table\_obj\_id()

Function that fetches an obj\_id of named table from AK\_relation system table.

#### **Author**

Dejan Frankovic

# **Parameters**

```
*table table name
```

## Returns

obj\_id of the table or EXIT\_ERROR if there is no table with that name

# 7.45.4.11 AK\_get\_tuple()

Function that fetches a value in some row and column.

## Author

Matija Šestak.

#### **Parameters**

row	zero-based row index
column	zero-based column index
*tblName	table name

#### Returns

value in the list

## Author

Matija Šestak

## **Parameters**

row	zero-based row index
column	zero-based column index
*tblName	table name

#### Returns

value in the list

# 7.45.4.12 AK\_num\_attr()

Functions that determines the number of attributes in the table.

## Author

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. else read the first block
- 4. while header tuple exists in the block, increment num\_attr

## **Parameters**

\* tblName table name

#### Returns

number of attributes in the table

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. else read the first block
- 4. while header tuple exists in the block, increment num\_attr

#### **Parameters**

```
* tblName table name
```

#### Returns

number of attributes in the table

## 7.45.4.13 AK\_op\_rename\_test()

```
TestResult AK_op_rename_test ( )
```

Function for renaming operator testing (moved from rename.c)

Author

Mislav Čakarić, edited by Ljubo Barać

Returns

TestResult containing information on the amount of failed/passed tests

Author

Mislav Čakarić, edited by Ljubo Barać

Returns

No return value

## 7.45.4.14 AK\_print\_row()

```
void AK_print_row (
          int col_len[],
          struct list_node * row )
```

Function that prints table row.

Author

Dino Laktašić

## **Parameters**

col_len[]	array of max lengths for each attribute	
*row	list with row elements	

## Returns

No return value

# 7.45.4.15 AK\_print\_row\_spacer()

Function that prints row spacer.

## Author

Dino Laktašić.

## **Parameters**

	col_len[]	max lengths for each attribute cell
ſ	length	total table width

# Returns

printed row spacer

# 7.45.4.16 AK\_print\_row\_spacer\_to\_file()

```
void AK_print_row_spacer_to_file (
          int col_len[],
          int length )
```

Function that prints row spacer update by Luka Rajcevic.

#### **Author**

Dino Laktašić.

## **Parameters**

col_len[]	max lengths for each attribute cell
length	total table width

#### Returns

printed row spacer

## 7.45.4.17 AK\_print\_row\_to\_file()

```
void AK_print_row_to_file (
          int col_len[],
          struct list_node * row )
```

Function that prints the table row update by Luka Rajcevic.

#### Author

Dino Laktašić

### **Parameters**

col_len[]	array of max lengths for each attribute
*row	list with row elements

## Returns

No return value

# 7.45.4.18 AK\_print\_table()

Function for printing table.

### Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one)

*tblName	table name
* IDIINAITIE	lable Hallle

#### Returns

No return value

#### **Author**

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one), updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

*tblName table name
---------------------

#### Returns

No return value

## 7.45.4.19 AK\_print\_table\_to\_file()

Function that prints a table.

## Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one) update by Luka Rajcevic

#### **Parameters**

*tblName	table name

#### Returns

No return value update by Anto Tomaš (corrected the AK\_DeleteAll\_L3 function)

## Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one), updated by Josip Šušnjara (chained blocks support) update by Luka Rajcevic

#### Returns

No return value update by Anto Tomaš (corrected the AK\_DeleteAll\_L3 function)

## 7.45.4.20 AK\_rename()

Function for renaming table and/or attribute in table (moved from rename.c)

#### **Author**

Mislav Čakarić edited by Ljubo Barać

## **Parameters**

old_table_name	old name of the table
new_table_name	new name of the table
old_attr	name of the attribute to rename
new_attr	new name for the attribute to rename

## Returns

EXIT\_ERROR or EXIT\_SUCCESS

## 7.45.4.21 AK\_table\_empty()

Function that checks whether the table is empty.

## Author

Matija Šestak.

*tblName	table name

Returns

true/false

## 7.45.4.22 AK\_table\_test()

```
TestResult AK_table_test ( )
```

Function for testing table abstraction.

**Author** 

Matija Šestak

Returns

TestResult containing information on the amount of failed/passed tests

@update by Ana-Marija Balen - added getRow function to the test @update by Barbara Tatai - fixed SIGSEGV (caused by storing char pointers into integers), fixed successful/failed counter

**Author** 

Unknown

Returns

No return value

@update by Ana-Marija Balen - added getRow function to the test

## 7.45.4.23 AK\_temp\_create\_table()

```
void AK_temp_create_table (
            char * table,
            AK_header * header,
             int type_segment )
```

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

**Author** 

Matija Novak, updated by Dino Laktašić

## **Parameters**

table	table name
header	AK_header of the new table
type_segment	type of the new segment

Generated by Doxygen

## Returns

No return value

## 7.45.4.24 AK\_tuple\_to\_string()

Function that converts tuple value to string.

Author

Matija Šestak.

#### **Parameters**

```
*tuple | tuple in the list
```

#### Returns

tuple value as a string

## 7.45.4.25 get\_row\_attr\_data()

Function that returns the value of an attribute from the row.

Author

Leon Palaić

#### **Parameters**

column	index of column atribute
*row	list with row elements

## Returns

atribute data

### 7.46 file/tableOld.c File Reference

#include "../file/table.h"
Include dependency graph for tableOld.c:

#### **Functions**

• AK\_create\_table\_parameter \* AK\_create\_create\_table\_parameter (int type, char \*name)

Constructs a table parameter struct object.

void AK create table (char \*tblName, AK create table parameter \*parameters, int attribute count)

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

void AK\_temp\_create\_table (char \*table, AK\_header \*header, int type\_segment)

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

• int AK num attr (char \*tblName)

Functions that determines the number of attributes in the table.

• int AK\_get\_num\_records (char \*tblName)

Function that determines the number of rows in the table.

AK header \* AK get header (char \*tblName)

Function that fetches the table header.

char \* AK\_get\_attr\_name (char \*tblName, int index)

Function that fetches attribute name for some zero-based index.

• int AK\_get\_attr\_index (char \*tblName, char \*attrName)

Function that fetches zero-based index for attribute.

struct list\_node \* AK\_get\_column (int num, char \*tblName)

Function that fetches all values in some column and put on the list.

struct list\_node \* AK\_get\_row (int num, char \*tblName)

Function that fetches all values in some row and put on the list.

• struct list\_node \* AK\_get\_tuple (int row, int column, char \*tblName)

Function that fetches a value in some row and column.

char \* AK\_tuple\_to\_string (struct list\_node \*tuple)

Function that converts tuple value to string.

void AK\_print\_row\_spacer (int col\_len[], int length)

Function that prints row spacer.

void AK\_print\_row (int col\_len[], struct list\_node \*row)

Function that prints table row.

int AK\_table\_exist (char \*tblName)

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

void AK print table (char \*tblName)

Function for printing table.

void AK\_print\_row\_spacer\_to\_file (int col\_len[], int length)

Function that prints row spacer update by Luka Rajcevic.

char \* get\_row\_attr\_data (int column, struct list\_node \*node)

Function that returns the value of an attribute from the row.

void AK print row to file (int col len[], struct list node \*row)

Function that prints the table row update by Luka Rajcevic.

void AK\_print\_table\_to\_file (char \*tblName)

Function that prints a table.

• int AK\_table\_empty (char \*tblName)

Function that checks whether the table is empty.

int AK\_get\_table\_obj\_id (char \*table)

Function that fetches an obj\_id of named table from AK\_relation system table.

 int AK\_check\_tables\_scheme (AK\_mem\_block \*tbl1\_temp\_block, AK\_mem\_block \*tbl2\_temp\_block, char \*operator\_name)

Function that checks if tables have the same relation schema.

int AK\_rename (char \*old\_table\_name, char \*old\_attr, char \*new\_table\_name, char \*new\_attr)

Function for renaming table and/or attribute in table (moved from rename.c)

TestResult AK\_table\_test ()

Function for testing table abstraction.

TestResult AK\_op\_rename\_test ()

Function for renaming operator testing (moved from rename.c)

## 7.46.1 Function Documentation

## 7.46.1.1 AK\_check\_tables\_scheme()

Function that checks if tables have the same relation schema.

#### **Author**

Dino Laktašić, abstracted from difference.c for use in difference.c, intersect.c and union.c by Tomislav Mikulček

#### **Parameters**

tbl1_temp_block	first cache block of the first table
tbl2_temp_block	first cache block of the second table
operator_name	the name of operator, used for displaying error message

## Returns

if success returns num of attributes in schema, else returns EXIT\_ERROR

#### 7.46.1.2 AK\_create\_create\_table\_parameter()

Constructs a table parameter struct object.

### Author

Unknown

#### **Parameters**

type	parameter type
name	parameter name

## Returns

A pointer to the constructed AK\_create\_table\_parameter object

# 7.46.1.3 AK\_create\_table()

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

Creates a table.

#### Author

Matija Novak, updated by Dino Laktašić

# Parameters

table	table name
header	AK_header of the new table
type_segment	type of the new segment

# Returns

No return value

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

## Author

Unknown, updated by Josip Šušnjara (chained blocks support)

tblName	Name the name of the table	
parameters	table parameters array (each parameter contains name and type)	
attribute_count	the amount of attributes	

## Returns

No return value

# 7.46.1.4 AK\_get\_attr\_index()

Function that fetches zero-based index for attribute.

**Author** 

Matija Šestak.

#### **Parameters**

*tblName	table name
*attrName	attribute name

#### Returns

zero-based index

# 7.46.1.5 AK\_get\_attr\_name()

Function that fetches attribute name for some zero-based index.

Author

Matija Šestak.

# **Parameters**

*tblName	table name
index	zero-based index

## Returns

attribute name

## 7.46.1.6 AK\_get\_column()

Function that fetches all values in some column and put on the list.

#### **Author**

Matija Šestak.

#### **Parameters**

num	zero-based column index
*tblName	table name

#### Returns

column values list

## 7.46.1.7 AK\_get\_header()

Function that fetches the table header.

## Author

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return 0
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

*tblName   table name
-----------------------

#### Returns

array of table header

## 7.46.1.8 AK\_get\_num\_records()

Function that determines the number of rows in the table.

#### **Author**

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

### **Parameters**

```
*tableName | table name
```

# Returns

number of rows in the table

## 7.46.1.9 AK\_get\_row()

Function that fetches all values in some row and put on the list.

#### **Author**

Markus Schatten, Matija Šestak.

## **Parameters**

num	zero-based row index
*	tblName table name

#### Returns

row values list

# 7.46.1.10 AK\_get\_table\_obj\_id()

Function that fetches an obj\_id of named table from AK\_relation system table.

## Author

Dejan Frankovic

#### **Parameters**

### Returns

obj\_id of the table or EXIT\_ERROR if there is no table with that name

# 7.46.1.11 AK\_get\_tuple()

```
struct list_node* AK_get_tuple (
    int row,
    int column,
    char * tblName )
```

Function that fetches a value in some row and column.

## **Author**

Matija Šestak.

#### **Parameters**

row	zero-based row index
column	zero-based column index
*tblName	table name

Generated by Doxygen

#### Returns

value in the list

## 7.46.1.12 AK\_num\_attr()

Functions that determines the number of attributes in the table.

#### **Author**

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. else read the first block
- 4. while header tuple exists in the block, increment num\_attr

#### **Parameters**

\* tblName table name

#### Returns

number of attributes in the table

## 7.46.1.13 AK\_op\_rename\_test()

```
TestResult AK_op_rename_test ( )
```

Function for renaming operator testing (moved from rename.c)

### Author

Mislav Čakarić, edited by Ljubo Barać

## Returns

No return value

## 7.46.1.14 AK\_print\_row()

```
void AK_print_row (
          int col_len[],
          struct list_node * row )
```

Function that prints table row.

**Author** 

Dino Laktašić

#### **Parameters**

col_len[]	array of max lengths for each attribute
*row	list with row elements

## Returns

No return value

## 7.46.1.15 AK\_print\_row\_spacer()

```
void AK_print_row_spacer (
          int col_len[],
          int length )
```

Function that prints row spacer.

Author

Dino Laktašić.

# Parameters

col_len[]	max lengths for each attribute cell
length	total table width

#### Returns

printed row spacer

# 7.46.1.16 AK\_print\_row\_spacer\_to\_file()

Function that prints row spacer update by Luka Rajcevic.

**Author** 

Dino Laktašić.

#### **Parameters**

col_len[]	max lengths for each attribute cell
length	total table width

#### Returns

printed row spacer

# 7.46.1.17 AK\_print\_row\_to\_file()

```
void AK_print_row_to_file (
          int col_len[],
          struct list_node * row )
```

Function that prints the table row update by Luka Rajcevic.

Author

Dino Laktašić

### **Parameters**

col_len[]	array of max lengths for each attribute
*row	list with row elements

#### Returns

No return value

## 7.46.1.18 AK\_print\_table()

Function for printing table.

Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one)

*tblName	table name
----------	------------

#### Returns

No return value

## 7.46.1.19 AK\_print\_table\_to\_file()

Function that prints a table.

### Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one) update by Luka Rajcevic

### **Parameters**

```
*tblName table name
```

### Returns

No return value update by Anto Tomaš (corrected the AK\_DeleteAll\_L3 function)

# 7.46.1.20 AK\_rename()

Function for renaming table and/or attribute in table (moved from rename.c)

#### **Author**

Mislav Čakarić edited by Ljubo Barać

#### **Parameters**

old_table_name	old name of the table
new_table_name	new name of the table
old attr Generated by Doxygen	name of the attribute to rename
new_attr	new name for the attribute to rename

#### Returns

EXIT\_ERROR or EXIT\_SUCCESS

## 7.46.1.21 AK\_table\_empty()

Function that checks whether the table is empty.

Author

Matija Šestak.

### **Parameters**

*tblName   table name
-----------------------

## Returns

true/false

# 7.46.1.22 AK\_table\_exist()

Function that examines whether there is a table with the name "tblName" in the system catalog (AK\_relation)

**Author** 

Jurica Hlevnjak

### **Parameters**

tblName table r
-----------------

#### Returns

returns 1 if table exist or returns 0 if table does not exist

## 7.46.1.23 AK\_table\_test()

```
TestResult AK_table_test ( )
```

Function for testing table abstraction.

Author

Unknown

Returns

No return value

@update by Ana-Marija Balen - added getRow function to the test

## 7.46.1.24 AK\_temp\_create\_table()

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

Author

Matija Novak, updated by Dino Laktašić

#### **Parameters**

table	table name
header	AK_header of the new table
type_segment	type of the new segment

Returns

No return value

## 7.46.1.25 AK\_tuple\_to\_string()

Function that converts tuple value to string.

Author

Matija Šestak.

#### **Parameters**

*tuple	tuple in the list
--------	-------------------

### Returns

tuple value as a string

### 7.46.1.26 get\_row\_attr\_data()

Function that returns the value of an attribute from the row.

### **Author**

Leon Palaić

#### **Parameters**

column	index of column atribute
*row	list with row elements

### Returns

atribute data

# 7.47 file/tableOld.h File Reference

```
#include "../auxi/test.h"
#include "../mm/memoman.h"
#include "../auxi/mempro.h"
#include <time.h>
Include dependency graph for tableOld.h:
```

### **Classes**

struct AK\_create\_table\_struct

## **Macros**

• #define TABLE

### **Typedefs**

typedef struct AK\_create\_table\_struct AK\_create\_table\_parameter

#### **Functions**

• AK\_create\_table\_parameter \* AK\_create\_create\_table\_parameter (int type, char \*name)

Constructs a table parameter struct object.

• void AK\_create\_table (char \*tblName, AK\_create\_table\_parameter \*parameters, int attribute\_count)

Creates a table.

• void AK\_temp\_create\_table (char \*table, AK\_header \*header, int type\_segment)

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

int AK\_num\_attr (char \*tblName)

Functions that determines the number of attributes in the table.

• int AK\_get\_num\_records (char \*tblName)

Function that determines the number of rows in the table.

AK\_header \* AK\_get\_header (char \*tblName)

Function that fetches the table header.

char \* AK\_get\_attr\_name (char \*tblName, int index)

Function that fetches attribute name for some zero-based index.

int AK\_get\_attr\_index (char \*tblName, char \*attrName)

Function that fetches zero-based index for attribute.

struct list node \* AK get column (int num, char \*tblName)

Function that fetches all values in some column and put on the list.

struct list\_node \* AK\_get\_row (int num, char \*tblName)

Function that fetches all values in some row and put on the list.

struct list\_node \* AK\_get\_tuple (int row, int column, char \*tblName)

Function that fetches a value in some row and column.

char \* AK\_tuple\_to\_string (struct list\_node \*tuple)

Function that converts tuple value to string.

void AK\_print\_row\_spacer (int col\_len[], int length)

Function that prints row spacer.

void AK\_print\_row (int col\_len[], struct list\_node \*row)

Function that prints table row.

void AK\_print\_table (char \*tblName)

Function for printing table.

void AK\_print\_row\_spacer\_to\_file (int col\_len[], int length)

Function that prints row spacer update by Luka Rajcevic.

void AK\_print\_row\_to\_file (int col\_len[], struct list\_node \*row)

Function that prints the table row update by Luka Rajcevic.

void AK\_print\_table\_to\_file (char \*tblName)

Function that prints a table.

• int AK\_table\_empty (char \*tblName)

Function that checks whether the table is empty.

int AK\_get\_table\_obj\_id (char \*table)

Function that fetches an obj\_id of named table from AK\_relation system table.

 int AK\_check\_tables\_scheme (AK\_mem\_block \*tbl1\_temp\_block, AK\_mem\_block \*tbl2\_temp\_block, char \*operator\_name)

Function that checks if tables have the same relation schema.

char \* get\_row\_attr\_data (int column, struct list\_node \*node)

Function that returns the value of an attribute from the row.

TestResult AK\_table\_test ()

Function for testing table abstraction.

• int AK\_rename (char \*old\_table\_name, char \*old\_attr, char \*new\_table\_name, char \*new\_attr)

Function for renaming table and/or attribute in table (moved from rename.c)

• TestResult AK\_op\_rename\_test ()

Function for renaming operator testing (moved from rename.c)

### 7.47.1 Macro Definition Documentation

#### 7.47.1.1 TABLE

#define TABLE

## 7.47.2 Typedef Documentation

### 7.47.2.1 AK\_create\_table\_parameter

```
{\tt typedef \ struct \ AK\_create\_table\_struct \ AK\_create\_table\_parameter}
```

#### 7.47.3 Function Documentation

### 7.47.3.1 AK\_check\_tables\_scheme()

Function that checks if tables have the same relation schema.

#### **Author**

Dino Laktašić, abstracted from difference.c for use in difference.c, intersect.c and union.c by Tomislav Mikulček

#### **Parameters**

tbl1_temp_block	first cache block of the first table
tbl2_temp_block	first cache block of the second table
operator_name	the name of operator, used for displaying error message

#### Returns

if success returns num of attributes in schema, else returns EXIT\_ERROR

## 7.47.3.2 AK\_create\_create\_table\_parameter()

Constructs a table parameter struct object.

Author

Unknown

#### **Parameters**

type	parameter type
name	parameter name

#### Returns

A pointer to the constructed AK\_create\_table\_parameter object

### 7.47.3.3 AK\_create\_table()

Creates a table.

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

Author

Unknown, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

tblName	the name of the table
parameters	table parameters array (each parameter contains name and type)
attribute count	the amount of attributes

#### Returns

No return value

Creates a table.

**Author** 

Matija Novak, updated by Dino Laktašić

#### **Parameters**

table	table name
header	AK_header of the new table
type_segment	type of the new segment

### Returns

No return value

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

## Author

Unknown, updated by Josip Šušnjara (chained blocks support)

## **Parameters**

tblName	the name of the table
parameters	table parameters array (each parameter contains name and type)
attribute_count	the amount of attributes

### Returns

No return value

# 7.47.3.4 AK\_get\_attr\_index()

Function that fetches zero-based index for attribute.

### Author

Matija Šestak.

*tblName	table name
*attrName	attribute name

#### Returns

zero-based index

# 7.47.3.5 AK\_get\_attr\_name()

Function that fetches attribute name for some zero-based index.

## Author

Matija Šestak

#### **Parameters**

*tblName	table name
index	zero-based index

# Returns

attribute name

### Author

Matija Šestak.

## **Parameters**

*tblName	table name
index	zero-based index

### Returns

attribute name

## 7.47.3.6 AK\_get\_column()

Function that fetches all values in some column and put on the list.

### Author

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

num	zero-based column index
*tblName	table name

### Returns

column values list

#### **Author**

Matija Šestak.

## **Parameters**

num	zero-based column index
*tblName	table name

#### Returns

column values list

## 7.47.3.7 AK\_get\_header()

Function that fetches the table header.

### Author

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return 0
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

#### Returns

array of table header

#### **Author**

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return 0
- 3. else read the first block
- 4. allocate array
- 5. copy table header to the array

#### **Parameters**

#### Returns

array of table header

## 7.47.3.8 AK\_get\_num\_records()

Function that determines the number of rows in the table.

### Author

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

#### **Parameters**

*tableName	table name
------------	------------

#### Returns

number of rows in the table

#### **Author**

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. For each extent from table
- 4. For each block in the extent
- 5. Get a block
- 6. Exit if there is no records in block
- 7. Count tuples in block
- 8. Return the number of tuples divided by number of attributes

### **Parameters**

*tableName table name	
-----------------------	--

#### Returns

number of rows in the table

## 7.47.3.9 AK\_get\_row()

Function that fetches all values in some row and put on the list.

# Author

Markus Schatten, Matija Šestak.

#### **Parameters**

num	zero-based row index	
*	tblName table name	

### Returns

row values list

## 7.47.3.10 AK\_get\_table\_obj\_id()

Function that fetches an obj\_id of named table from AK\_relation system table.

#### **Author**

Dejan Frankovic

### **Parameters**

*table 1	table name
----------	------------

### Returns

obj\_id of the table or EXIT\_ERROR if there is no table with that name

# 7.47.3.11 AK\_get\_tuple()

Function that fetches a value in some row and column.

## Author

Matija Šestak

### **Parameters**

row	zero-based row index
column	zero-based column index
*tblName	table name

## Returns

value in the list

#### Author

Matija Šestak.

#### **Parameters**

row	zero-based row index
column	zero-based column index
*tblName	table name

#### Returns

value in the list

## 7.47.3.12 AK\_num\_attr()

Functions that determines the number of attributes in the table.

#### **Author**

Matija Šestak, updated by Josip Šušnjara (chained blocks support)

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. else read the first block
- 4. while header tuple exists in the block, increment num\_attr

### Parameters

```
* tblName table name
```

### Returns

number of attributes in the table

### Author

Matija Šestak.

- 1. Read addresses of extents
- 2. If there is no extents in the table, return EXIT\_WARNING
- 3. else read the first block
- 4. while header tuple exists in the block, increment num\_attr

```
* tblName table name
```

#### Returns

number of attributes in the table

## 7.47.3.13 AK\_op\_rename\_test()

```
TestResult AK_op_rename_test ( )
```

Function for renaming operator testing (moved from rename.c)

**Author** 

Mislav Čakarić, edited by Ljubo Barać

## Returns

TestResult containing information on the amount of failed/passed tests

**Author** 

Mislav Čakarić, edited by Ljubo Barać

Returns

No return value

## 7.47.3.14 AK\_print\_row()

```
void AK_print_row (
          int col_len[],
          struct list_node * row )
```

Function that prints table row.

**Author** 

Dino Laktašić

### **Parameters**

col_len[]	array of max lengths for each attribute
*row	list with row elements

## Returns

No return value

## 7.47.3.15 AK\_print\_row\_spacer()

```
void AK_print_row_spacer (
          int col_len[],
          int length )
```

Function that prints row spacer.

Author

Dino Laktašić.

#### **Parameters**

col_len[]	max lengths for each attribute cell
length	total table width

## Returns

printed row spacer

# 7.47.3.16 AK\_print\_row\_spacer\_to\_file()

```
void AK_print_row_spacer_to_file (
          int col_len[],
          int length )
```

Function that prints row spacer update by Luka Rajcevic.

**Author** 

Dino Laktašić.

col_len[]	max lengths for each attribute cell
length	total table width

#### Returns

printed row spacer

# 7.47.3.17 AK\_print\_row\_to\_file()

```
void AK_print_row_to_file (
          int col_len[],
          struct list_node * row )
```

Function that prints the table row update by Luka Rajcevic.

#### Author

Dino Laktašić

#### **Parameters**

col_len[]	array of max lengths for each attribute
*row	list with row elements

### Returns

No return value

# 7.47.3.18 AK\_print\_table()

Function for printing table.

#### Author

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one), updated by Josip Šušnjara (chained blocks support)

#### **Parameters**

*tblName	table name
----------	------------

#### Returns

No return value

#### **Author**

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one)

#### **Parameters**

*tblName	table name
----------	------------

#### Returns

No return value

## 7.47.3.19 AK\_print\_table\_to\_file()

Function that prints a table.

### **Author**

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one), updated by Josip Šušnjara (chained blocks support) update by Luka Rajcevic

#### **Parameters**

*tblName	table name
----------	------------

### Returns

No return value update by Anto Tomaš (corrected the AK\_DeleteAll\_L3 function)

## **Author**

Dino Laktašić and Mislav Čakarić (replaced old print table function by new one) update by Luka Rajcevic

### Returns

No return value update by Anto Tomaš (corrected the AK\_DeleteAll\_L3 function)

# 7.47.3.20 AK\_rename()

Function for renaming table and/or attribute in table (moved from rename.c)

### **Author**

Mislav Čakarić edited by Ljubo Barać

#### **Parameters**

old_table_name	old name of the table
new_table_name	new name of the table
old_attr	name of the attribute to rename
new_attr	new name for the attribute to rename

# Returns

EXIT\_ERROR or EXIT\_SUCCESS

### 7.47.3.21 AK\_table\_empty()

Function that checks whether the table is empty.

### Author

Matija Šestak.

#### **Parameters**

*tblName	table name
----------	------------

Returns

true/false

#### 7.47.3.22 AK\_table\_test()

```
TestResult AK_table_test ( )
```

Function for testing table abstraction.

**Author** 

Matija Šestak

Returns

TestResult containing information on the amount of failed/passed tests

@update by Ana-Marija Balen - added getRow function to the test @update by Barbara Tatai - fixed SIGSEGV (caused by storing char pointers into integers), fixed successful/failed counter

Author

Unknown

Returns

No return value

@update by Ana-Marija Balen - added getRow function to the test

### 7.47.3.23 AK\_temp\_create\_table()

Temporary function that creates table, and inserts an entry to the system\_relation catalog.

Author

Matija Novak, updated by Dino Laktašić

table	table name
header	AK_header of the new table
type_segment	type of the new segment

### Returns

No return value

## 7.47.3.24 AK\_tuple\_to\_string()

Function that converts tuple value to string.

## Author

Matija Šestak.

### **Parameters**

*tuple	tuple in the list
--------	-------------------

#### Returns

tuple value as a string

# 7.47.3.25 get\_row\_attr\_data()

Function that returns the value of an attribute from the row.

## Author

Leon Palaić

#### **Parameters**

column	index of column atribute
*row	list with row elements

Returns

atribute data

## 7.48 mm/memoman.c File Reference

```
#include "memoman.h"
#include "../dm/dbman.h"
Include dependency graph for memoman.c:
```

#### **Functions**

• int AK cache block (int num, AK mem block \*mem block)

Function that caches a block into the memory.

int AK\_cache\_AK\_malloc ()

Function that initializes the global cache memory (variable db cache)

int AK\_redo\_log\_AK\_malloc ()

Function that initializes the global redo log memory (variable redo\_log)

int AK\_find\_available\_result\_block ()

Function that finds the available block for result caching in a circular array.

unsigned long AK\_generate\_result\_id (unsigned char \*str)

Function that generates a unique hash identifier for each cached result by using djb2 algorithm.

void AK cache result (char \*srcTable, AK block \*temp block, AK header header[])

Function that caches the fetched result block in memory.

int AK\_query\_mem\_AK\_malloc ()

Function that initializes the global query memory (variable query\_mem)

void AK\_query\_mem\_AK\_free ()

Function that releases the global query memory (variable query\_mem)

• int AK\_memoman\_init ()

Function that initializes the memory manager (cache, redo log and query memory)

AK\_mem\_block \* AK\_get\_block (int num)

Function that reads a block from the memory. If the block is cached, returns the cached block. Else uses  $AK\_\leftarrow$  cache\_block to read the block to cache and then returns it.

• int AK release oldest cache block ()

Functions that flushes the oldest block to disk and recalculates the next block to remove.

int AK\_mem\_block\_modify (AK\_mem\_block \*mem\_block, int dirty)

Function that modifies the "dirty" bit of a block, and update the timestamps accordingly.

• int AK refresh cache ()

Function that re-reads all the blocks from the disk.

• table addresses \* AK get index segment addresses (char \*segmentName)

Function for getting a index segment address.

table\_addresses \* AK\_get\_segment\_addresses (char \*segmentName)

Function for getting a relation segment address.

• table\_addresses \* AK\_get\_segment\_addresses\_internal (char \*tableName, char \*segmentName)

Function for getting addresses of some table.

int AK\_get\_system\_table\_address (const char \*name)

Function that gets the address of a system table by name.

table addresses \* AK get table addresses (char \*table)

Function for getting addresses of some table.

table\_addresses \* AK\_get\_index\_addresses (char \*index)

Function for getting addresses of some index.

• int AK\_find\_AK\_free\_space (table\_addresses \*addresses)

Function that finds AK\_free space in some block betwen block addresses. It's made for insert\_row()

• int AK\_init\_new\_extent (char \*table\_name, int extent\_type)

Function that extends the segment.

• int AK\_flush\_cache ()

Function that flushes memory blocks to disk file.

- TestResult AK memoman test ()
- TestResult AK\_memoman\_test2 ()

## 7.48.1 Detailed Description

Defines functions for the memory manager of Kalashnikov DB

### 7.48.2 Function Documentation

# 7.48.2.1 AK\_cache\_AK\_malloc()

```
int AK_cache_AK_malloc ( )
```

Function that initializes the global cache memory (variable db\_cache)

Author

Markus Schatten, Matija Šestak(revised)

Returns

EXIT\_SUCCESS if the cache memory has been initialized, EXIT\_ERROR otherwise

#### 7.48.2.2 AK\_cache\_block()

Function that caches a block into the memory.

**Author** 

Nikola Bakoš, Matija Šestak(revised)

#### **Parameters**

num	block number (address)
mem_block	address of memmory block

#### Returns

EXIT\_SUCCESS if the block has been successfully read into memory, EXIT\_ERROR otherwise

```
read the block from the given address
```

```
set dirty bit in mem_block struct
```

get the timestamp

set timestamp\_read

set timestamp\_last\_change

# 7.48.2.3 AK\_cache\_result()

Function that caches the fetched result block in memory.

Author

Mario Novoselec

### 7.48.2.4 AK\_find\_AK\_free\_space()

Function that finds AK\_free space in some block betwen block addresses. It's made for insert\_row()

Author

Matija Novak, updated by Matija Šestak( function now uses caching)

#### **Parameters**

1-1	
aaaress	addresses of extents

Returns

address of the block to write in

## 7.48.2.5 AK\_find\_available\_result\_block()

```
int AK_find_available_result_block ( )
```

Function that finds the available block for result caching in a circular array.

**Author** 

Mario Novoselec

Returns

available\_index

### 7.48.2.6 AK\_flush\_cache()

```
int AK_flush_cache ( )
```

Function that flushes memory blocks to disk file.

Author

Matija Šestak, updated by Antonio Martinović

Returns

EXIT\_SUCCESS

if block form cache can not be writed to DB file -> EXIT\_ERROR

block is clean after successfuly writing it to disk

# 7.48.2.7 AK\_generate\_result\_id()

Function that generates a unique hash identifier for each cached result by using djb2 algorithm.

Author

Mario Novoselec

Returns

hash

### 7.48.2.8 AK\_get\_block()

Function that reads a block from the memory. If the block is cached, returns the cached block. Else uses AK\_cache\_block to read the block to cache and then returns it.

Author

Tomislav Fotak, updated by Matija Šestak, Antonio Martinović

#### **Parameters**

num block number (ac	ldress)
----------------------	---------

#### Returns

segment start address

found cached! we're done here

while looking for block we also want to find an empty block in case that the actual block is not found then there is no need to run through the blocks twice

created new cache block for specified address

no free cache blocks found, we need to clear some now

no cache for you

#### 7.48.2.9 AK\_get\_index\_addresses()

Function for getting addresses of some index.

Author

Mislav Čakarić

## **Parameters**

index	index name that you search for
-------	--------------------------------

#### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

### 7.48.2.10 AK\_get\_index\_segment\_addresses()

Function for getting a index segment address.

@Author Antonio Martinović

#### **Parameters**

segmentName	table name that you search for
-------------	--------------------------------

#### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

### 7.48.2.11 AK\_get\_segment\_addresses()

Function for getting a relation segment address.

Function for getting a index segment address.

@Author Antonio Martinović

### **Parameters**

segmentName	table name that you search for

## Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

### 7.48.2.12 AK\_get\_segment\_addresses\_internal()

Function for getting addresses of some table.

#### Author

Matija Novak, updated by Matija Šestak, Mislav Čakarić, Antonio Martinović

#### **Parameters**

tableName	table name that you search for
segmentName	segment name

#### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

## 7.48.2.13 AK\_get\_system\_table\_address()

Function that gets the address of a system table by name.

#### **Author**

Matija Novak, updated by Matija Šestak, Mislav Čakarić, Antonio Martinović

#### **Parameters**

name	of system table
------	-----------------

### Returns

table address

## 7.48.2.14 AK\_get\_table\_addresses()

Function for getting addresses of some table.

### Author

Mislav Čakarić

table   table name that you search fo	or
---------------------------------------	----

### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

## 7.48.2.15 AK\_init\_new\_extent()

Function that extends the segment.

#### **Author**

Nikola Bakoš, updated by Matija Šestak (function now uses caching), updated by Mislav Čakarić, updated by Dino Laktašić

### Parameters

table_name	name of segment to extent
extent_type	type of extent (can be one of: SEGMENT_TYPE_SYSTEM_TABLE, SEGMENT_TYPE_TABLE,
	SEGMENT_TYPE_INDEX, SEGMENT_TYPE_TRANSACTION, SEGMENT_TYPE_TEMP

#### Returns

address of new extent, otherwise EXIT\_ERROR

!! to correct header BUG iterate through header from 0 to N-th block while there is

# 7.48.2.16 AK\_mem\_block\_modify()

Function that modifies the "dirty" bit of a block, and update the timestamps accordingly.

### Author

Alen Novosel.

# 7.48.2.17 AK\_memoman\_init()

```
int AK_memoman_init ( )
```

Function that initializes the memory manager (cache, redo log and query memory)

Author

Miroslav Policki

Returns

EXIT\_SUCCESS if the query memory manager has been initialized, EXIT\_ERROR otherwise

## 7.48.2.18 AK\_memoman\_test()

```
TestResult AK_memoman_test ( )
```

# 7.48.2.19 AK\_memoman\_test2()

```
TestResult AK_memoman_test2 ( )
```

# 7.48.2.20 AK\_query\_mem\_AK\_free()

```
void AK_query_mem_AK_free ( )
```

Function that releases the global query memory (variable query\_mem)

**Author** 

Elvis Popović

#### 7.48.2.21 AK\_query\_mem\_AK\_malloc()

```
int AK_query_mem_AK_malloc ( )
```

Function that initializes the global query memory (variable query\_mem)

**Author** 

Matija Novak

Returns

EXIT\_SUCCESS if the query memory has been initialized, EXIT\_ERROR otherwise

allocate memory for global variable query\_mem

allocate memory for variable query\_mem\_lib which is used in query\_mem->parsed allocate memory for variable query\_mem\_dict which is used in query\_mem->dictionary allocate memory for variable query\_mem\_result which is used in query\_mem->result allocate memory for variable tuple\_dict which is used in query\_mem->dictionary->dictionary[]

#### 7.48.2.22 AK\_redo\_log\_AK\_malloc()

```
int AK_redo_log_AK_malloc ( )
```

Function that initializes the global redo log memory (variable redo\_log)

**Author** 

Dejan Sambolić updated by Dražen Bandić, updated by Tomislav Turek

Returns

EXIT\_SUCCESS if the redo log memory has been initialized, EXIT\_ERROR otherwise

#### 7.48.2.23 AK\_refresh\_cache()

```
int AK_refresh_cache ( )
```

Function that re-reads all the blocks from the disk.

**Author** 

Matija Šestak.

Returns

EXIT\_SUCCESS

#### 7.48.2.24 AK\_release\_oldest\_cache\_block()

```
int AK_release_oldest_cache_block ( )
```

Functions that flushes the oldest block to disk and recalculates the next block to remove.

**Author** 

Antonio Martinović

Returns

index of flushed cache block

if block form cache can not be writed to DB file -> EXIT\_ERROR

block is clean after successfuly writing it to disk

## 7.49 mm/memoman.h File Reference

```
#include "../auxi/test.h"
#include "../dm/dbman.h"
#include "../auxi/mempro.h"
#include "../auxi/ptrcontainer.h"
```

Include dependency graph for memoman.h: This graph shows which files directly or indirectly include this file:

#### Classes

struct AK\_mem\_block

Structure that defines a block of data in memory.

struct AK\_db\_cache

Structure that defines global cache memory.

• struct AK\_command\_recovery\_struct

recovery structure used to recover commands from binary file

struct AK redo log

Structure that defines global redo log.

struct AK\_query\_mem\_lib

Structure that defines global query memory for libraries.

• struct AK\_query\_mem\_dict

Structure that defines global query memory for data dictionaries.

struct AK\_results

Structure used for in-memory result caching.

struct AK\_query\_mem\_result

Structure that defines global query memory for results.

struct AK\_query\_mem

Structure that defines global query memory.

#### **Functions**

void AK cache result (char \*srcTable, AK block \*temp block, AK header header[])

Function that caches the fetched result block in memory.

· int AK find available result block ()

Function that finds the available block for result caching in a circular array.

• unsigned long AK generate result id (unsigned char \*str)

Function that generates a unique hash identifier for each cached result by using djb2 algorithm.

int AK\_cache\_block (int num, AK\_mem\_block \*mem\_block)

Function that caches a block into the memory.

int AK\_cache\_AK\_malloc ()

Function that initializes the global cache memory (variable db\_cache)

• int AK redo log AK malloc ()

Function that initializes the global redo log memory (variable redo log)

int AK\_query\_mem\_AK\_malloc ()

Function that initializes the global query memory (variable query\_mem)

void AK\_query\_mem\_AK\_free ()

Function that releases the global query memory (variable query\_mem)

• int AK memoman init ()

Function that initializes the memory manager (cache, redo log and query memory)

AK\_mem\_block \* AK\_get\_block (int num)

Function that reads a block from the memory. If the block is cached, returns the cached block. Else uses AK\_← cache block to read the block to cache and then returns it.

int AK\_release\_oldest\_cache\_block ()

Functions that flushes the oldest block to disk and recalculates the next block to remove.

int AK\_mem\_block\_modify (AK\_mem\_block \*mem\_block, int dirty)

Function that modifies the "dirty" bit of a block, and update the timestamps accordingly.

• int AK refresh cache ()

Function that re-reads all the blocks from the disk.

table\_addresses \* AK\_get\_segment\_addresses\_internal (char \*tableName, char \*segmentName)

Function for getting addresses of some table.

table\_addresses \* AK\_get\_segment\_addresses (char \*segmentName)

Function for getting a index segment address.

table\_addresses \* AK\_get\_index\_segment\_addresses (char \*segmentName)

Function for getting a index segment address.

table\_addresses \* AK\_get\_table\_addresses (char \*table)

Function for getting addresses of some table.

table\_addresses \* AK\_get\_index\_addresses (char \*index)

Function for getting addresses of some index.

int AK\_find\_AK\_free\_space (table\_addresses \*addresses)

Function that finds AK\_free space in some block betwen block addresses. It's made for insert\_row()

int AK\_init\_new\_extent (char \*table\_name, int extent\_type)

Function that extends the segment.

• int AK\_flush\_cache ()

Function that flushes memory blocks to disk file.

- TestResult AK memoman test ()
- TestResult AK\_memoman\_test2 ()

### **Variables**

• PtrContainer db\_cache

Variable that defines the db cache.

• PtrContainer redo\_log

Variable that defines the global redo log.

• PtrContainer query\_mem

Variable that defines the global query memory.

# 7.49.1 Detailed Description

Header file that contains data structures, defines and functions for the memory manager of Kalashnikov DB

### 7.49.2 Function Documentation

#### 7.49.2.1 AK\_cache\_AK\_malloc()

```
int AK_cache_AK_malloc ( )
```

Function that initializes the global cache memory (variable db\_cache)

Author

Markus Schatten, Matija Šestak(revised)

Returns

EXIT\_SUCCESS if the cache memory has been initialized, EXIT\_ERROR otherwise

# 7.49.2.2 AK\_cache\_block()

```
int AK_cache_block (
          int num,
          AK_mem_block * mem_block )
```

Function that caches a block into the memory.

Author

Nikola Bakoš, Matija Šestak(revised)

num	block number (address)
mem_block	address of memmory block

#### Returns

EXIT\_SUCCESS if the block has been successfully read into memory, EXIT\_ERROR otherwise

```
read the block from the given address
```

```
set dirty bit in mem_block struct
```

get the timestamp

set timestamp\_read

set timestamp\_last\_change

# 7.49.2.3 AK\_cache\_result()

Function that caches the fetched result block in memory.

Author

Mario Novoselec

### 7.49.2.4 AK\_find\_AK\_free\_space()

Function that finds AK\_free space in some block betwen block addresses. It's made for insert\_row()

Author

Matija Novak, updated by Matija Šestak( function now uses caching)

#### **Parameters**

addrace	addresses of extents
auuicss	audicooco di calcillo

#### Returns

address of the block to write in

## 7.49.2.5 AK\_find\_available\_result\_block()

```
int AK_find_available_result_block ( )
```

Function that finds the available block for result caching in a circular array.

**Author** 

Mario Novoselec

Returns

available\_index

## 7.49.2.6 AK\_flush\_cache()

```
int AK_flush_cache ( )
```

Function that flushes memory blocks to disk file.

Author

Matija Šestak, updated by Antonio Martinović

Returns

```
EXIT_SUCCESS
```

if block form cache can not be writed to DB file -> EXIT\_ERROR

block is clean after successfuly writing it to disk

# 7.49.2.7 AK\_generate\_result\_id()

Function that generates a unique hash identifier for each cached result by using djb2 algorithm.

Author

Mario Novoselec

Returns

hash

# 7.49.2.8 AK\_get\_block()

Function that reads a block from the memory. If the block is cached, returns the cached block. Else uses AK\_cache\_block to read the block to cache and then returns it.

Author

Tomislav Fotak, updated by Matija Šestak, Antonio Martinović

#### **Parameters**

num	block number (address)
-----	------------------------

### Returns

segment start address

found cached! we're done here

while looking for block we also want to find an empty block in case that the actual block is not found then there is no need to run through the blocks twice

created new cache block for specified address

no free cache blocks found, we need to clear some now

no cache for you

### 7.49.2.9 AK\_get\_index\_addresses()

Function for getting addresses of some index.

Author

Mislav Čakarić

#### **Parameters**

index	index name that you search for
-------	--------------------------------

## Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

# 7.49.2.10 AK\_get\_index\_segment\_addresses()

Function for getting a index segment address.

@Author Antonio Martinović

**Parameters** 

segmentN
----------

### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

# 7.49.2.11 AK\_get\_segment\_addresses()

Function for getting a index segment address.

@Author Antonio Martinović

# **Parameters**

segmentName	table name that you search for

# Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

Function for getting a index segment address.

@Author Antonio Martinović

segmentName	table name that you search for
-------------	--------------------------------

#### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

# 7.49.2.12 AK\_get\_segment\_addresses\_internal()

Function for getting addresses of some table.

### **Author**

Matija Novak, updated by Matija Šestak, Mislav Čakarić, Antonio Martinović

#### **Parameters**

tableName	table name that you search for
segmentName	segment name

### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

### 7.49.2.13 AK get table addresses()

Function for getting addresses of some table.

# **Author**

Mislav Čakarić

4-1-1-	1-1-1 11-11-1
table	table name that you search for

#### Returns

structure table\_addresses witch contains start and end adresses of table extents, when form and to are 0 you are on the end of addresses

# 7.49.2.14 AK\_init\_new\_extent()

Function that extends the segment.

### **Author**

Nikola Bakoš, updated by Matija Šestak (function now uses caching), updated by Mislav Čakarić, updated by Dino Laktašić

# **Parameters**

table_name	name of segment to extent
extent_type	type of extent (can be one of: SEGMENT_TYPE_SYSTEM_TABLE, SEGMENT_TYPE_TABLE,
	SEGMENT_TYPE_INDEX, SEGMENT_TYPE_TRANSACTION, SEGMENT_TYPE_TEMP

# Returns

address of new extent, otherwise EXIT\_ERROR

!! to correct header BUG iterate through header from 0 to N-th block while there is

### 7.49.2.15 AK\_mem\_block\_modify()

Function that modifies the "dirty" bit of a block, and update the timestamps accordingly.

# Author

Alen Novosel.

# 7.49.2.16 AK\_memoman\_init()

```
int AK_memoman_init ( )
```

Function that initializes the memory manager (cache, redo log and query memory)

Author

Miroslav Policki

# Returns

EXIT\_SUCCESS if the query memory manager has been initialized, EXIT\_ERROR otherwise

# 7.49.2.17 AK\_memoman\_test()

```
TestResult AK_memoman_test ( )
```

# 7.49.2.18 AK\_memoman\_test2()

```
TestResult AK_memoman_test2 ( )
```

# 7.49.2.19 AK\_query\_mem\_AK\_free()

```
void AK_query_mem_AK_free ( )
```

Function that releases the global query memory (variable query\_mem)

**Author** 

Elvis Popović

## 7.49.2.20 AK\_query\_mem\_AK\_malloc()

```
int AK_query_mem_AK_malloc ( )
```

Function that initializes the global query memory (variable query\_mem)

**Author** 

Matija Novak

Returns

EXIT\_SUCCESS if the query memory has been initialized, EXIT\_ERROR otherwise

allocate memory for global variable query\_mem

allocate memory for variable query\_mem\_lib which is used in query\_mem->parsed allocate memory for variable query\_mem\_dict which is used in query\_mem->dictionary allocate memory for variable query\_mem\_result which is used in query\_mem->result allocate memory for variable tuple\_dict which is used in query\_mem->dictionary->dictiona

# 7.49.2.21 AK\_redo\_log\_AK\_malloc()

```
int AK_redo_log_AK_malloc ( )
```

Function that initializes the global redo log memory (variable redo\_log)

**Author** 

Dejan Sambolić updated by Dražen Bandić, updated by Tomislav Turek

Returns

EXIT\_SUCCESS if the redo log memory has been initialized, EXIT\_ERROR otherwise

### 7.49.2.22 AK\_refresh\_cache()

```
int AK_refresh_cache ( )
```

Function that re-reads all the blocks from the disk.

**Author** 

Matija Šestak.

Returns

EXIT\_SUCCESS

## 7.49.2.23 AK\_release\_oldest\_cache\_block()

```
int AK_release_oldest_cache_block ( )
```

Functions that flushes the oldest block to disk and recalculates the next block to remove.

Author

Antonio Martinović

Returns

index of flushed cache block

if block form cache can not be writed to DB file -> EXIT\_ERROR

block is clean after successfuly writing it to disk

# 7.49.3 Variable Documentation

### 7.49.3.1 db\_cache

db\_cache

Variable that defines the db cache.

# 7.49.3.2 query\_mem

query\_mem

Variable that defines the global query memory.

# 7.49.3.3 redo\_log

redo\_log

Variable that defines the global redo log.

# 7.50 opti/query\_optimization.c File Reference

#include "query\_optimization.h"
Include dependency graph for query\_optimization.c:

# **Functions**

void AK\_print\_optimized\_query (struct list\_node \*list\_query)

Function that prints optimization table for testing purposes.

• struct list\_node \* AK\_execute\_rel\_eq (struct list\_node \*list\_query, const char rel\_eq, const char \*FLAGS)

Function that calls and executes relation equivalence RELATION EQUIVALENCE RULES FLAGS c - commutation a

struct list\_node \* AK\_query\_optimization (struct list\_node \*list\_query, const char \*FLAGS, const int DIFF
 PLANS)

Function that executes all relational equivalences provided by FLAGS (one or more), if DIFF\_PLANS turned on execute permutations without repetition on given RA list from SQL parser output.

• TestResult AK\_query\_optimization\_test ()

- associativity p - projection s - selection

### **Variables**

• int error message =0

# 7.50.1 Detailed Description

Provides functions for general query optimization

### 7.50.2 Function Documentation

# 7.50.2.1 AK\_execute\_rel\_eq()

Function that calls and executes relation equivalence RELATION EQUIVALENCE RULES FLAGS c - commutation a - associativity p - projection s - selection

#### **Author**

Dino Laktašić.

*list_query	RA expresion list where we need to apply relational equivalences rules
rel_eq	rel_eq to execute
*FLAGS	flags for relation equivalences (execute rel_eq for given flags)

### Returns

returns struct list\_node (RA expresion list) optimized by given relational equivalence rule

# 7.50.2.2 AK\_print\_optimized\_query()

Function that prints optimization table for testing purposes.

# Author

Dino Laktašić.

#### **Parameters**

# Returns

list output

# 7.50.2.3 AK\_query\_optimization()

Function that executes all relational equivalences provided by FLAGS (one or more), if DIFF\_PLANS turned on execute permutations without repetition on given RA list from SQL parser output.

# **Author**

Dino Laktašić.

*list_query	RA expresion list where we need to apply relational equivalences rules
*FLAGS	flags for relation equivalences (execute rel_eq for given flags)

#### Returns

returns AK\_list (RA expresion list) optimized by all relational equivalence rules provided by FLAGS (commented code can be edited so AK\_list can return the list of lists (lists of different optimization plans), with permutation switched on (DIFF\_PLANS = 1) time for execution will be significantly increased Current implementation without uncommenting code doesn't produce list of list, it rather apply all permutations on the same list

For futher development consider to implement cost estimation for given plan based on returned heuristicly optimized list

# 7.50.2.4 AK\_query\_optimization\_test()

```
TestResult AK_query_optimization_test ( )
```

#### **Author**

Dino Laktašić

#### **Parameters**

	Function	for testing *list_query query to be optimized
--	----------	---

#### Returns

No return value

## 7.50.3 Variable Documentation

### 7.50.3.1 error\_message

```

# **Macros**

• #define MAX PERMUTATION 24

Constant declaring maximum number of permutations.

# **Functions**

- void AK\_print\_optimized\_query (struct list\_node \*list\_query)
   Function that prints optimization table for testing purposes.
- struct list\_node \* AK\_execute\_rel\_eq (struct list\_node \*list\_query, const char rel\_eq, const char \*FLAGS)
   Function that calls and executes relation equivalence RELATION EQUIVALENCE RULES FLAGS c commutation a associativity p projection s selection
- struct list\_node \* AK\_query\_optimization (struct list\_node \*list\_query, const char \*FLAGS, const int DIFF
   \_\_PLANS)

Function that executes all relational equivalences provided by FLAGS (one or more), if DIFF\_PLANS turned on execute permutations without repetition on given RA list from SQL parser output.

TestResult AK query optimization test ()

# 7.51.1 Detailed Description

Header file that provides data structure, functions and defines for general query optimization

# 7.51.2 Macro Definition Documentation

### 7.51.2.1 MAX PERMUTATION

```
#define MAX_PERMUTATION 24
```

Constant declaring maximum number of permutations.

### 7.51.3 Function Documentation

## 7.51.3.1 AK execute rel eq()

Function that calls and executes relation equivalence RELATION EQUIVALENCE RULES FLAGS c - commutation a - associativity p - projection s - selection

Author

Dino Laktašić.

### **Parameters**

*list_query	RA expresion list where we need to apply relational equivalences rules
rel_eq	rel_eq to execute
*FLAGS	flags for relation equivalences (execute rel_eq for given flags)

### Returns

returns struct list\_node (RA expresion list) optimized by given relational equivalence rule

# 7.51.3.2 AK\_print\_optimized\_query()

Function that prints optimization table for testing purposes.

#### **Author**

Dino Laktašić.

### **Parameters**

*list_query	optimized RA expresion list
-------------	-----------------------------

#### Returns

list output

# 7.51.3.3 AK\_query\_optimization()

Function that executes all relational equivalences provided by FLAGS (one or more), if DIFF\_PLANS turned on execute permutations without repetition on given RA list from SQL parser output.

### **Author**

Dino Laktašić.

#### **Parameters**

*list_query	RA expresion list where we need to apply relational equivalences rules
*FLAGS	flags for relation equivalences (execute rel_eq for given flags)

#### Returns

returns AK\_list (RA expresion list) optimized by all relational equivalence rules provided by FLAGS (commented code can be edited so AK\_list can return the list of lists (lists of different optimization plans), with permutation switched on (DIFF\_PLANS = 1) time for execution will be significantly increased Current implementation without uncommenting code doesn't produce list of list, it rather apply all permutations on the same list

For futher development consider to implement cost estimation for given plan based on returned heuristicly optimized list

# 7.51.3.4 AK\_query\_optimization\_test()

```
TestResult AK_query_optimization_test ( )
```

### **Author**

Dino Laktašić

#### **Parameters**

1	Function	for testing *list_query query to be optimized
---	----------	---

### Returns

No return value

# 7.52 opti/rel\_eq\_assoc.c File Reference

```
#include "rel_eq_assoc.h"
#include "rel_eq_projection.h"
Include dependency graph for rel eq assoc.c:
```

### **Functions**

• int AK\_compare (const void \*a, const void \*b)

Function for Struct cost\_eval comparison.

• struct list\_node \* AK\_rel\_eq\_assoc (struct list\_node \*list\_rel\_eq)

Main function for generation of RA expresion according to associativity equivalence rules.

void AK\_print\_rel\_eq\_assoc (struct list\_node \*list\_rel\_eq)

Function for printing RA expresion struct list node.

TestResult AK\_rel\_eq\_assoc\_test ()

Function for testing relational equivalences regarding associativity.

# 7.52.1 Detailed Description

Provides functions for relational equivalences regarding associativity

# 7.52.2 Function Documentation

# 7.52.2.1 AK\_compare()

Function for Struct cost\_eval comparison.

**Author** 

Dino Laktašić

### **Parameters**

*a	first value
*b	second value

### Returns

returns result of comparison

# 7.52.2.2 AK\_print\_rel\_eq\_assoc()

Function for printing RA expresion struct list\_node.

**Author** 

Dino Laktašić.

*list_rel_eq	RA expresion as the struct list_node
--------------	--------------------------------------

#### Returns

optimised RA expresion as the struct list\_node

# 7.52.2.3 AK\_rel\_eq\_assoc()

Main function for generation of RA expresion according to associativity equivalence rules.

# Author

Dino Laktašić.

#### **Parameters**

```
*list_rel_eq RA expresion as the struct list_node
```

#### Returns

optimised RA expresion as the struct list\_node

# 7.52.2.4 AK\_rel\_eq\_assoc\_test()

```
TestResult AK_rel_eq_assoc_test ( )
```

Function for testing relational equivalences regarding associativity.

# Author

Dino Laktašić.

## Returns

No return value

### **Functions**

int AK\_rel\_eq\_is\_subset (struct list\_node \*list\_elem\_set, struct list\_node \*list\_elem\_subset)

Function that checks if some set of attributes is subset of larger set, used in cascading of the projections.

• int AK\_rel\_eq\_can\_commute (struct list\_node \*list\_elem\_attribs, struct list\_node \*list\_elem\_conds)

Function that checks if selection uses only attributes retained by the projection before commuting.

• struct list\_node \* AK\_rel\_eq\_get\_attributes (char \*tblName)

Function that gets attributes for a given table and store them to the struct list node.

• char \* AK\_rel\_eq\_projection\_attributes (char \*attribs, char \*tblName)

Function used for filtering and returning only those attributes from list of projection attributes that exist in the given table

• char \* AK\_rel\_eq\_collect\_cond\_attributes (struct list\_node \*list\_elem)

Function used for filtering and returning only attributes from selection or theta\_join condition.

char \* AK\_rel\_eq\_remove\_duplicates (char \*attribs)

Function which removes duplicate attributes from attributes expresion.

struct list\_node \* AK\_rel\_eq\_projection (struct list\_node \*list\_rel\_eq)

Main function for generating RA expresion according to projection equivalence rules.

void AK\_print\_rel\_eq\_projection (struct list\_node \*list\_rel\_eq)

Function for printing AK\_list to the screen.

TestResult AK\_rel\_eq\_projection\_test ()

Function for testing rel\_eq\_selection.

# 7.56.1 Detailed Description

Provides functions for for relational equivalences in projection

### 7.56.2 Function Documentation

# 7.56.2.1 AK\_print\_rel\_eq\_projection()

Function for printing AK list to the screen.

**Author** 

Dino Laktašić.

#### **Parameters**

\*list rel eq RA expresion as the AK list

#### Returns

No return value

# 7.56.2.2 AK\_rel\_eq\_can\_commute()

Function that checks if selection uses only attributes retained by the projection before commuting.

### **Author**

Dino Laktašić.

- 1. Tokenize set of projection attributes and store them to the array
- 2. For each attribute in selection condition check if exists in array of projection attributes
- 3. if exists increment match variable and break
- 4. else continue checking until the final attribute is checked
- 5. if match variable value equals 0 than return 0
- 6. else if match variable value greater than EXIT\_SUCCESS, return EXIT\_FAILURE

# **Parameters**

lis	t_elem_attribs	list element containing projection data
lis	t_elem_conds	list element containing selection condition data

### Returns

EXIT\_SUCCESS if selection uses only attributes retained by projection, else returns EXIT\_FAILURE

### 7.56.2.3 AK rel eq collect cond attributes()

Function used for filtering and returning only attributes from selection or theta\_join condition.

# **Author**

Dino Laktašić.

### **Parameters**

lem list element that contains se	ection or theta_join condition data
-----------------------------------	-------------------------------------

# Returns

only attributes from selection or theta\_join condition as the AK\_list

# 7.56.2.4 AK\_rel\_eq\_get\_attributes()

Function that gets attributes for a given table and store them to the struct list\_node.

### **Author**

Dino Laktašić.

- 1. Get the number of attributes in a given table
- 2. Get the table header for a given table
- 3. Initialize struct list\_node
- 4. For each attribute in table header, insert attribute in struct list\_node as new struct list\_node element
- 5. return struct list\_node

# **Parameters**

```
*tblName name of the table
```

### Returns

struct list\_node

# 7.56.2.5 AK\_rel\_eq\_is\_subset()

Function that checks if some set of attributes is subset of larger set, used in cascading of the projections.

#### Author

Rules to implement Rule 1. projection comutes with selection that only uses attributes retained by the projection p[L](s[L1](R)) = s[L1](p[L](R)) Rule 2. only the last in a sequence of projection operations is needed, the others can be omitted. p L1 = p[L1](R) Rule 3a. distribution according to theta join, only if join includes attributes from L1 u L2  $p[L1 \ u \ L2](R1 \ t \ R2) = (p[L1](R1)) \ t (p[L2](R2))$  Rule 3b. Let L1 u L2 be attributes from R1 and R2, respectively. Let L3 be attributes from R1, but are not in L1 u L2 and let L4 be attributes from R2, but are not in L1 u L2.  $p[L1 \ u \ L2](R1 \ t \ R2) = p[L1 \ u \ L2]((p[L1 \ u \ L3](R1)) \ t (p[L2 \ u \ L4](R2)))$  Rule 4. distribution according to union  $p[L](R1 \ u \ R2) = (p[L](R1)) \ u \ (p[L](R2))$ 

#### Author

Dino Laktašić.

- 1. Tokenize set and subset of projection attributes and store each of them to it's own array
- 2. Check if the size of subset array is larger than the size of set array
- 3. if the subset array is larger return 0
- 4. else sort both arrays ascending
- 5. Compare the subset and set items at the same positions, starting from 0
- 6. if there is an item in the subset array that doesn't match attribute at the same position in the set array return 0
- 7. else continue comparing until final item in the subset array is ritched
- 8. on loop exit return EXIT\_SUCCESS

#### **Parameters**

list_elem_set	first list element containing projection attributes
list_elem_subset	second list element containing projection attributes

# Returns

EXIT\_SUCCESS if some set of attributes is subset of larger set, else returns EXIT\_FAILURE

# 7.56.2.6 AK\_rel\_eq\_projection()

Main function for generating RA expresion according to projection equivalence rules.

# **Author**

Dino Laktašić.

#### **Parameters**

*list_rel_eq	RA expresion as the AK_list
--------------	-----------------------------

# Returns

optimised RA expresion as the AK\_list

# 7.56.2.7 AK\_rel\_eq\_projection\_attributes()

Function used for filtering and returning only those attributes from list of projection attributes that exist in the given table

#### **Author**

Dino Laktašić.

- 1. Get the attributes for a given table and store them to the AK\_list
- 2. Tokenize set of projection attributes and store them to the array
- 3. For each attribute in the array check if exists in the previously created AK\_list
- 4. if exists append attribute to the dynamic atributes char array
- 5. return pointer to char array with stored attribute/s

### **Parameters**

*attribs	projection attributes delimited by ";" (ATTR_DELIMITER)
*tblName	name of the table

# Returns

filtered list of projection attributes as the AK\_list

# 7.56.2.8 AK\_rel\_eq\_projection\_test()

```
TestResult AK_rel_eq_projection_test ( )
```

Function for testing rel\_eq\_selection.

**Author** 

Dino Laktašić.

Returns

No return value

# 7.56.2.9 AK\_rel\_eq\_remove\_duplicates()

Function which removes duplicate attributes from attributes expresion.

**Author** 

Dino Laktašić.

#### **Parameters**

\*attribs attributes from which to remove duplicates

Returns

pointer to char array without duplicate attributes

# 7.57 opti/rel eq projection.h File Reference

EXIT\_SUCCESS if some set of attributes is subset of larger set, else returns EXIT\_FAILURE

# 7.57.2.6 AK\_rel\_eq\_projection()

Main function for generating RA expresion according to projection equivalence rules.

## **Author**

Dino Laktašić.

#### **Parameters**

*list_rel_eq	RA expresion as the AK_list
--------------	-----------------------------

# Returns

optimised RA expresion as the AK\_list

# 7.57.2.7 AK\_rel\_eq\_projection\_attributes()

Function used for filtering and returning only those attributes from list of projection attributes that exist in the given table

#### **Author**

Dino Laktašić.

- 1. Get the attributes for a given table and store them to the AK\_list
- 2. Tokenize set of projection attributes and store them to the array
- 3. For each attribute in the array check if exists in the previously created AK list
- 4. if exists append attribute to the dynamic atributes char array
- 5. return pointer to char array with stored attribute/s

### **Parameters**

*attribs	projection attributes delimited by ";" (ATTR_DELIMITER)
*tblName	name of the table

# Returns

filtered list of projection attributes as the AK\_list

# 7.57.2.8 AK\_rel\_eq\_projection\_test()

```
TestResult AK_rel_eq_projection_test ( )
```

Function for testing rel\_eq\_selection.

**Author** 

Dino Laktašić.

#### Returns

No return value

# 7.57.2.9 AK\_rel\_eq\_remove\_duplicates()

Function which removes duplicate attributes from attributes expresion.

**Author** 

Dino Laktašić.

#### **Parameters**

\*attribs attributes from which to remove duplicates

# Returns

pointer to char array without duplicate attributes

# 7.58 opti/rel\_eq\_selection.c File Reference

```
#include "rel_eq_selection.h"
#include "../auxi/auxiliary.h"
Include dependency graph for rel_eq_selection.c:
```

### **Functions**

• int AK\_rel\_eq\_is\_attr\_subset (char \*set, char \*subset)

Function that checks if some set of attributes is subset of larger set.

char \* AK\_rel\_eq\_get\_atrributes\_char (char \*tblName)

Function that fetches attributes for a given table and store them to the char array.

char \* AK\_rel\_eq\_cond\_attributes (char \*cond)

Function for filtering and returning attributes from condition.

int AK\_rel\_eq\_share\_attributes (char \*set, char \*subset)

Function that checks if two sets share one or more of it's attributes.

struct list node \* AK rel eq split condition (char \*cond)

Function that checks if selection can commute with theta-join or product (if working with conditions in infix format use this function instead - also remember to change code at the other places)

struct list\_node \* AK\_rel\_eq\_selection (struct list\_node \*list\_rel\_eq)

Main function for generating RA expresion according to selection equivalence rules.

void AK\_print\_rel\_eq\_selection (struct list\_node \*list\_rel\_eq)

Function for printing struct list\_node to the screen.

TestResult AK\_rel\_eq\_selection\_test ()

Function for testing rel\_eq\_selection.

# 7.58.1 Detailed Description

Provides functions for for relational equivalences in selection

### 7.58.2 Function Documentation

# 7.58.2.1 AK\_print\_rel\_eq\_selection()

Function for printing struct list\_node to the screen.

Author

Dino Laktašić.

Parameters

```
*list_rel_eq RA expresion as the struct list_node
```

Returns

void

# 7.58.2.2 AK\_rel\_eq\_cond\_attributes()

Function for filtering and returning attributes from condition.

Author

Dino Laktašić.

### **Parameters**

\*cond | condition array that contains condition data

# Returns

pointer to array that contains attributes for a given condition

# 7.58.2.3 AK\_rel\_eq\_get\_atrributes\_char()

Function that fetches attributes for a given table and store them to the char array.

### **Author**

Dino Laktašić.

- 1. Get the number of attributes in a given table
- 2. If there is no attributes return NULL
- 3. Get the table header for a given table
- 4. Initialize struct list\_node
- 5. For each attribute in table header, insert attribute in the array
- 6. Delimit each new attribute with ";" (ATTR\_DELIMITER)
- 7. return pointer to char array

# **Parameters**

```
*tblName name of the table
```

# Returns

pointer to char array

# 7.58.2.4 AK\_rel\_eq\_is\_attr\_subset()

Function that checks if some set of attributes is subset of larger set.

#### Author

Dino Laktašić.

- 1. Tokenize set and subset of projection attributes and store each of them to it's own array
- 2. Check if the size of subset array is larger than the size of set array
- 3. if the subset array is larger return 0
- 4. else sort both arrays ascending
- 5. Compare the subset and set items at the same positions, starting from 0
- 6. if there is an item in the subset array that doesn't match attribute at the same position in the set array return 0
- 7. else continue comparing until final item in the subset array is ritched
- 8. on loop exit return EXIT SUCCESS

#### **Parameters**

*set	set array
*subset	subset array

#### Returns

EXIT\_SUCCESS if some set of attributes is subset of larger set, else returns EXIT\_FAILURE

# 7.58.2.5 AK\_rel\_eq\_selection()

Main function for generating RA expresion according to selection equivalence rules.

#### Author

Dino Laktašić.

#### **Parameters**

*list_rel_eq	RA expresion as the struct list_node
--------------	--------------------------------------

#### Returns

optimised RA expresion as the struct list\_node

# 7.58.2.6 AK\_rel\_eq\_selection\_test()

```
TestResult AK_rel_eq_selection_test ( )
```

Function for testing rel\_eq\_selection.

#### Author

Dino Laktašić.

#### Returns

No return value

# 7.58.2.7 AK\_rel\_eq\_share\_attributes()

Function that checks if two sets share one or more of it's attributes.

#### **Author**

Dino Laktašić.

- 1. If is empty set or subset returns EXIT\_FAILURE
- 2. For each attribute in one set check if there is same attribute in the second set
- 3. If there is the same attribute return EXIT\_SUCCESS
- 4. else remove unused pointers and return EXIT\_FAILURE

#### **Parameters**

*set	first set of attributes delimited by ";" (ATTR_DELIMITER)
*subset	second set of attributes delimited by ";" (ATTR_DELIMITER)

### Returns

EXIT\_SUCCESS if set and subset share at least one attribute, else returns EXIT\_FAILURE

# 7.58.2.8 AK\_rel\_eq\_split\_condition()

Function that checks if selection can commute with theta-join or product (if working with conditions in infix format use this function instead - also remember to change code at the other places)

Break conjunctive conditions to individual conditions.

#### **Author**

#### Dino Laktašić.

- 1. For each token (delimited by " ") in selection condition first check if token represents attribute/s and is subset in the given table
- 2. If token is a subset set variable id to 1
- 3. else check if token differs from "OR", and if so, set id to 0, else make no changes to variable id
- 4. if token equals to "AND" and id equals to 1 append collected conds to result condition
- 5. else if token equals to "AND" and id equals to 0 discarge collected conds
- 6. else append token to collected data
- 7. When exits from loop if id greater then 0, append the last collected data to result
- 8. return pointer to char array that contains new condition for a given table

#### **Parameters**

*cond	condition array that contains condition data
*tblName	name of the table

#### Returns

pointer to char array that contains new condition for a given table

#### Author

Dino Laktašić.

Break conjunctive conditions to individual conditions (currently not used - commented in main AK\_rel\_eq\_selection function), it can be usefull in some optimization cases

- 1. For each delimited item (' AND ') insert item to the struct list node
- 2. Remove unused pointers and return the conditions list

### **Parameters**

```
*cond condition expression
```

#### Returns

conditions list

# 7.59 opti/rel\_eq\_selection.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../auxi/mempro.h"
```

Include dependency graph for rel\_eq\_selection.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

int AK\_rel\_eq\_is\_attr\_subset (char \*set, char \*subset)

Function that checks if some set of attributes is subset of larger set.

char \* AK\_rel\_eq\_get\_atrributes\_char (char \*tblName)

Function that fetches attributes for a given table and store them to the char array.

• char \* AK\_rel\_eq\_cond\_attributes (char \*cond)

Function for filtering and returning attributes from condition.

• int AK\_rel\_eq\_share\_attributes (char \*set, char \*subset)

Function that checks if two sets share one or more of it's attributes.

struct list\_node \* AK\_rel\_eq\_split\_condition (char \*cond)

Break conjunctive conditions to individual conditions.

struct list\_node \* AK\_rel\_eq\_selection (struct list\_node \*list\_rel\_eq)

Main function for generating RA expresion according to selection equivalence rules.

void AK\_print\_rel\_eq\_selection (struct list\_node \*list\_rel\_eq)

Function for printing struct list\_node to the screen.

TestResult AK\_rel\_eq\_selection\_test ()

Function for testing rel\_eq\_selection.

# 7.59.1 Detailed Description

Header file that provides data structures, functions and defines for relational equivalences in selection

### 7.59.2 Function Documentation

### 7.59.2.1 AK\_print\_rel\_eq\_selection()

Function for printing struct list node to the screen.

**Author** 

Dino Laktašić.

**Parameters** 

\*list\_rel\_eq RA expresion as the struct list\_node

Returns

void

# 7.59.2.2 AK\_rel\_eq\_cond\_attributes()

Function for filtering and returning attributes from condition.

**Author** 

Dino Laktašić.

#### **Parameters**

\*cond | condition array that contains condition data

#### Returns

pointer to array that contains attributes for a given condition

### 7.59.2.3 AK\_rel\_eq\_get\_atrributes\_char()

Function that fetches attributes for a given table and store them to the char array.

Author

Dino Laktašić.

# **Parameters**

\*tblName name of the table

#### Returns

pointer to char array

### **Author**

Dino Laktašić.

- 1. Get the number of attributes in a given table
- 2. If there is no attributes return NULL
- 3. Get the table header for a given table
- 4. Initialize struct list\_node
- 5. For each attribute in table header, insert attribute in the array

- 6. Delimit each new attribute with ";" (ATTR\_DELIMITER)
- 7. return pointer to char array

#### **Parameters**

$*tblName \mid$ name of the table
-----------------------------------

### Returns

pointer to char array

# 7.59.2.4 AK\_rel\_eq\_is\_attr\_subset()

Function that checks if some set of attributes is subset of larger set.

#### **Author**

Dino Laktašić.

#### **Parameters**

*set	set array
*subset	subset array

### Returns

EXIT\_SUCCESS if some set of attributes is subset of larger set, else returns EXIT\_FAILURE

#### Author

Dino Laktašić.

- 1. Tokenize set and subset of projection attributes and store each of them to it's own array
- 2. Check if the size of subset array is larger than the size of set array
- 3. if the subset array is larger return 0
- 4. else sort both arrays ascending
- 5. Compare the subset and set items at the same positions, starting from  $\boldsymbol{0}$
- 6. if there is an item in the subset array that doesn't match attribute at the same position in the set array return 0
- 7. else continue comparing until final item in the subset array is ritched
- 8. on loop exit return EXIT\_SUCCESS

#### **Parameters**

*set	set array
*subset	subset array

#### Returns

EXIT\_SUCCESS if some set of attributes is subset of larger set, else returns EXIT\_FAILURE

# 7.59.2.5 AK\_rel\_eq\_selection()

Main function for generating RA expresion according to selection equivalence rules.

**Author** 

Dino Laktašić.

#### **Parameters**

#### Returns

optimised RA expresion as the struct list\_node

# 7.59.2.6 AK\_rel\_eq\_selection\_test()

```
TestResult AK_rel_eq_selection_test ( )
```

Function for testing rel\_eq\_selection.

Author

Dino Laktašić.

Returns

No return value

# 7.59.2.7 AK\_rel\_eq\_share\_attributes()

Function that checks if two sets share one or more of it's attributes.

**Author** 

Dino Laktašić.

#### **Parameters**

*set	first set of attributes delimited by ";" (ATTR_DELIMITER)
*subset	second set of attributes delimited by ";" (ATTR_DELIMITER)

#### Returns

EXIT\_SUCCESS if set and subset share at least one attribute, else returns EXIT\_FAILURE

#### **Author**

Dino Laktašić.

- 1. If is empty set or subset returns EXIT FAILURE
- 2. For each attribute in one set check if there is same attribute in the second set
- 3. If there is the same attribute return EXIT\_SUCCESS
- 4. else remove unused pointers and return EXIT\_FAILURE

#### **Parameters**

*set	first set of attributes delimited by ";" (ATTR_DELIMITER)
*subset	second set of attributes delimited by ";" (ATTR_DELIMITER)

# Returns

EXIT\_SUCCESS if set and subset share at least one attribute, else returns EXIT\_FAILURE

# 7.59.2.8 AK\_rel\_eq\_split\_condition()

Break conjunctive conditions to individual conditions.

### Author

Dino Laktašić.

# **Parameters**

*cond condition expression	า
----------------------------	---

### Returns

conditions list

Break conjunctive conditions to individual conditions.

#### **Author**

#### Dino Laktašić.

1. For each token (delimited by " ") in selection condition first check if token represents attribute/s and is subset in the given table

- 2. If token is a subset set variable id to 1
- 3. else check if token differs from "OR", and if so, set id to 0, else make no changes to variable id
- 4. if token equals to "AND" and id equals to 1 append collected conds to result condition
- 5. else if token equals to "AND" and id equals to 0 discarge collected conds
- 6. else append token to collected data
- 7. When exits from loop if id greater then 0, append the last collected data to result
- 8. return pointer to char array that contains new condition for a given table

#### **Parameters**

*cond	condition array that contains condition data
*tblName	name of the table

#### Returns

pointer to char array that contains new condition for a given table

### Author

Dino Laktašić.

Break conjunctive conditions to individual conditions (currently not used - commented in main AK\_rel\_eq\_selection function), it can be usefull in some optimization cases

- 1. For each delimited item (' AND ') insert item to the struct list node
- 2. Remove unused pointers and return the conditions list

### Parameters

*cond	condition expression

#### Returns

conditions list

# 7.60 rec/archive\_log.c File Reference

```
#include "archive_log.h"
Include dependency graph for archive_log.c:
```

### **Functions**

```
    void AK_archive_log (int sig)
        Function for making archive log.
    char * AK_get_timestamp ()
        Function that returns the current timestamp.
    int AK_check_folder_archivelog ()
```

### 7.60.1 Function Documentation

## 7.60.1.1 AK\_archive\_log()

```
void AK_archive_log ( int \ sig \ )
```

Function for making archive log.

Function that creates a binary file that stores all commands that failed to execute with a number that shows the size of how many commands failed.

**Todo** this function takes static filename to store the failed commands, create certain logic that would make the function to use dynamic filename (this is partly implemented inside AK\_get\_timestamp, but there is no logic that uses the last file when recovering - recovery.c) {link} recovery.c function test

### **Author**

Dražen Bandić, update by Tomislav Turek

#### Returns

No retun value

### 7.60.1.2 AK\_check\_folder\_archivelog()

```
int AK_check_folder_archivelog ( )
```

### 7.60.1.3 AK\_get\_timestamp()

```
char* AK_get_timestamp ( )
```

Function that returns the current timestamp.

This function returns the current timestamp that could be concatenated to a log file in future usages.

**Author** 

Dražen Bandić main logic, replaced by Tomislav Turek

**Todo** Think about this in the future when creating multiple binary recovery files. Implementation gives the timestamp, but is not used anywhere for now.

Returns

char array in format day.month.year-hour:min:sec.usecu.bin

# 7.61 rec/archive\_log.h File Reference

```
#include "../file/table.h"
#include "sys/time.h"
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include "../auxi/mempro.h"
```

Include dependency graph for archive\_log.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

```
    void AK_archive_log (int sig)
    Function for making archive log.
```

char \* AK\_get\_timestamp ()

Function that returns the current timestamp.

# 7.61.1 Detailed Description

Header file that provides functions and defines for archive logging

### 7.61.2 Function Documentation

### 7.61.2.1 AK\_archive\_log()

```
void AK_archive_log ( int \ sig \ )
```

Function for making archive log.

**Author** 

Dražen Bandić, update by Tomislav Turek

#### Returns

No retun value

Function that creates a binary file that stores all commands that failed to execute with a number that shows the size of how many commands failed.

Todo this function takes static filename to store the failed commands, create certain logic that would make the function to use dynamic filename (this is partly implemented inside AK\_get\_timestamp, but there is no logic that uses the last file when recovering - recovery.c)

{link} recovery.c function test

#### **Author**

Dražen Bandić, update by Tomislav Turek

#### Returns

No retun value

# 7.61.2.2 AK\_get\_timestamp()

```
char* AK_get_timestamp ( )
```

Function that returns the current timestamp.

Author

Dražen Bandić main logic, replaced by Tomislav Turek

#### Returns

char array in format day.month.year-hour:min:sec.usecu.bin

This function returns the current timestamp that could be concatenated to a log file in future usages.

### Author

Dražen Bandić main logic, replaced by Tomislav Turek

**Todo** Think about this in the future when creating multiple binary recovery files. Implementation gives the timestamp, but is not used anywhere for now.

### Returns

char array in format day.month.year-hour:min:sec.usecu.bin

# 7.62 rec/recovery.c File Reference

```
#include "recovery.h"
Include dependency graph for recovery.c:
```

### **Functions**

• void AK\_recover\_archive\_log (char \*fileName)

Function that reads the binary file in which last commands were saved, and executes them.

void AK\_recovery\_insert\_row (char \*table, int commandNumber)

Function that inserts a new row in the table with attributes.

• int recovery\_insert\_row (char \*table, char \*\*attr\_name, char \*\*attributes, int n, int \*type)

Function that inserts row in table.

char \*\* AK\_recovery\_tokenize (char \*input, char \*delimiter, int valuesOrNot)

Function that tokenizes the input with the given delimiter and puts them in an double pointer structure (so we can execute an insert)

void AK\_recover\_operation (int sig)

Function that recovers and executes failed commands.

TestResult AK\_recovery\_test ()

Function for recovery testing.

• void AK\_load\_chosen\_log ()

Executes the recovery operation for the chosen bin file.

void AK\_load\_latest\_log ()

Executes the recovery operation for the latest bin file.

### **Variables**

• short grandfailure = 0

## 7.62.1 Detailed Description

Provides recovery functions.

#### 7.62.2 Function Documentation

### 7.62.2.1 AK\_load\_chosen\_log()

```
void AK_load_chosen_log ( )
```

Executes the recovery operation for the chosen bin file.

Function lists the contents of the archive\_log directory. The user then types in the name of the desired bin file to open and perform the neccessary actions.

**Author** 

Matija Večenaj

Pa	ra	m	ρi	ŀΔ	re

none

#### Returns

no value

# 7.62.2.2 AK\_load\_latest\_log()

```
void AK_load_latest_log ( )
```

Executes the recovery operation for the latest bin file.

Function reads the latest.txt file which contains the name of the latest bin file that's been created. Then it loads it and does the neccessary recovery operations.

#### **Author**

Matija Večenaj

#### **Parameters**

none

### Returns

no value

# 7.62.2.3 AK\_recover\_archive\_log()

Function that reads the binary file in which last commands were saved, and executes them.

Function opens the recovery binary file and executes all commands that were saved inside the redo\_log structure

# **Author**

Dražen Bandić, update by Tomislav Turek

#### **Parameters**

#### Returns

no value

### 7.62.2.4 AK\_recover\_operation()

```
void AK_recover_operation ( int \ sig \ )
```

Function that recovers and executes failed commands.

Function is called when SIGINT signal is sent to the system. All commands that are written to rec.bin file are recovered to the designated structure and then executed.

#### **Author**

Tomislav Turek

#### **Parameters**

sig required integer parameter for SIGINT handler functions

# 7.62.2.5 AK\_recovery\_insert\_row()

Function that inserts a new row in the table with attributes.

Function is given the table name with desired data that should be inserted inside. By using the table name, function retrieves table attributes names and their types which uses afterwards for insert\_data\_test function to insert data to designated table.

### **Author**

Dražen Bandić, updated by Tomislav Turek

#### **Parameters**

table	- table name to insert to
commandNumber	- number of current command

#### Returns

no value

# 7.62.2.6 AK\_recovery\_test()

```
TestResult AK_recovery_test ( )
```

Function for recovery testing.

Function does nothing while waiting a SIGINT signal (signal represents // doxygen @ for full description ??? system failure). Upon retrieving the signal it calls function AK\_recover\_operation which starts the recovery by building commands. To comply with the designated structure AK\_command\_recovery\_struct // {link} to struct ??? it writes dummy commands to the file log.log

#### **Author**

Tomislav Turek

### 7.62.2.7 AK\_recovery\_tokenize()

Function that tokenizes the input with the given delimiter and puts them in an double pointer structure (so we can execute an insert)

### **Author**

Dražen Bandić

# Parameters

input	- input to tokenize
delimiter	- delimiter
valuesOrNot	- 1 if the input are values, 0 otherwise

### Returns

new double pointer structure with tokens

### 7.62.2.8 recovery\_insert\_row()

Function that inserts row in table.

Author

Danko Bukovac

Returns

EXIT\_SUCCESS if insert is successful, else EXIT\_FAILURE

#### 7.62.3 Variable Documentation

### 7.62.3.1 grandfailure

```
short grandfailure = 0
```

this variable flags if system failed

# 7.63 rec/recovery.h File Reference

This graph shows which files directly or indirectly include this file:

### **Functions**

void AK\_recover\_archive\_log (char \*fileName)

Function that reads the binary file in which last commands were saved, and executes them.

void AK\_recovery\_insert\_row (char \*table, int commandNumber)

Function that inserts a new row in the table with attributes.

char \*\* AK\_recovery\_tokenize (char \*input, char \*delimiter, int valuesOrNot)

Function that tokenizes the input with the given delimiter and puts them in an double pointer structure (so we can execute an insert)

• TestResult AK\_recovery\_test ()

Function for recovery testing.

void AK\_recover\_operation (int sig)

Function that recovers and executes failed commands.

void AK\_load\_chosen\_log ()

Executes the recovery operation for the chosen bin file.

void AK\_load\_latest\_log ()

Executes the recovery operation for the latest bin file.

### 7.63.1 Function Documentation

# 7.63.1.1 AK\_load\_chosen\_log()

```
void AK_load_chosen_log ( )
```

Executes the recovery operation for the chosen bin file.

Function lists the contents of the archive\_log directory. The user then writes the name of the desired bin file to perform the neccessary actions.

#### **Author**

Matija Večenaj

#### **Parameters**

none

#### Returns

no value

Function lists the contents of the archive\_log directory. The user then types in the name of the desired bin file to open and perform the neccessary actions.

### Author

Matija Večenaj

#### **Parameters**

none

### Returns

no value

# 7.63.1.2 AK\_load\_latest\_log()

```
void AK_load_latest_log ( )
```

Executes the recovery operation for the latest bin file.

Function reads the latest.txt file which contains the name of the latest bin file that's been created. Then it loads it and does the neccessary recovery operations.

Matija Večenaj

#### **Parameters**

none

#### Returns

no value

# 7.63.1.3 AK\_recover\_archive\_log()

Function that reads the binary file in which last commands were saved, and executes them.

Function opens the recovery binary file and executes all commands that were saved inside the redo\_log structure

#### **Author**

Dražen Bandić, update by Tomislav Turek

### **Parameters**

```
fileName - name of the archive log
```

### Returns

no value

# 7.63.1.4 AK\_recover\_operation()

Function that recovers and executes failed commands.

Function is called when SIGINT signal is sent to the system. All commands that are written to rec.bin file are recovered to the designated structure and then executed.

### Author

Tomislav Turek

#### **Parameters**

sig required integer parameter for SIGINT handler functions

# 7.63.1.5 AK\_recovery\_insert\_row()

Function that inserts a new row in the table with attributes.

Function is given the table name with desired data that should be inserted inside. By using the table name, function retrieves table attributes names and their types which uses afterwards for insert\_data\_test function to insert data to designated table.

#### **Author**

Dražen Bandić, updated by Tomislav Turek

#### **Parameters**

table	- table name to insert to
commandNumber	- number of current command

### Returns

no value

### 7.63.1.6 AK\_recovery\_test()

```
TestResult AK_recovery_test ( )
```

Function for recovery testing.

Function does nothing while waiting a SIGINT signal (signal represents // doxygen @ for full description ??? system failure). Upon retrieving the signal it calls function AK\_recover\_operation which starts the recovery by building commands. To comply with the designated structure AK\_command\_recovery\_struct // {link} to struct ??? it writes dummy commands to the file log.log

### Author

Tomislav Turek

### 7.63.1.7 AK\_recovery\_tokenize()

Function that tokenizes the input with the given delimiter and puts them in an double pointer structure (so we can execute an insert)

#### **Author**

Dražen Bandić

#### **Parameters**

input	- input to tokenize
delimiter	- delimiter
valuesOrNot	- 1 if the input are values, 0 otherwise

#### Returns

new double pointer structure with tokens

# 7.64 rec/redo\_log.c File Reference

```
#include "redo_log.h"
Include dependency graph for redo_log.c:
```

#### **Functions**

• int AK\_add\_to\_redolog (int command, struct list\_node \*row\_root)

Function that adds a new element to redolog.

- void AK\_redolog\_commit ()
- int AK\_add\_to\_redolog\_select (int command, struct list\_node \*condition, char \*srcTable)

Function that adds a new select to redolog, commented code with the new select from select.c, current code works with selection.c.

• int AK\_check\_redo\_log\_select (int command, struct list\_node \*condition, char \*srcTable)

Function that checks redolog for select, works only with selection.c, not select.c.

void AK\_printout\_redolog ()

Function that prints out the content of redolog memory.

• char \* AK\_check\_attributes (char \*attributes)

Function that checks if the attribute contains '|', and if it does it replaces it with "\|".

# 7.64.1 Detailed Description

Provides redolog functions.

### 7.64.2 Function Documentation

### 7.64.2.1 AK\_add\_to\_redolog()

Function that adds a new element to redolog.

**Author** 

Krunoslav Bilić updated by Dražen Bandić, second update by Tomislav Turek

Returns

EXIT\_FAILURE if not allocated memory for ispis, otherwise EXIT\_SUCCESS

### 7.64.2.2 AK\_add\_to\_redolog\_select()

Function that adds a new select to redolog, commented code with the new select from select.c, current code works with selection.c.

Author

Danko Bukovac

Returns

EXIT\_FAILURE if not allocated memory for ispis, otherwise EXIT\_SUCCESS

### 7.64.2.3 AK\_check\_attributes()

Function that checks if the attribute contains '|', and if it does it replaces it with "\|".

**Author** 

Dražen Bandić

Returns

new attribute

### 7.64.2.4 AK\_check\_redo\_log\_select()

```
int AK_check_redo_log_select (
    int command,
    struct list_node * condition,
    char * srcTable )
```

Function that checks redolog for select, works only with selection.c, not select.c.

**Author** 

Danko Bukovac

#### Returns

0 if select was not found, otherwise 1

# 7.64.2.5 AK\_printout\_redolog()

```
void AK_printout_redolog ( )
```

Function that prints out the content of redolog memory.

Author

Krunoslav Bilić updated by Dražen Bandić, second update by Tomislav Turek

# Returns

No return value.

### 7.64.2.6 AK\_redolog\_commit()

```
void AK_redolog_commit ( )
```

# 7.65 rec/redo\_log.h File Reference

This graph shows which files directly or indirectly include this file:

#### **Functions**

- int AK\_add\_to\_redolog (int command, struct list\_node \*row\_root)
  - Function that adds a new element to redolog.
- int AK\_add\_to\_redolog\_select (int command, struct list\_node \*condition, char \*srcTable)

Function that adds a new select to redolog, commented code with the new select from select.c, current code works with selection.c.

• int AK\_check\_redo\_log\_select (int command, struct list\_node \*condition, char \*srcTable)

Function that checks redolog for select, works only with selection.c, not select.c.

void AK\_printout\_redolog ()

Function that prints out the content of redolog memory.

- void AK\_redolog\_commit ()
- char \* AK check attributes (char \*attributes)

Function that checks if the attribute contains '\', and if it does it replaces it with "\\".

#### 7.65.1 Function Documentation

## 7.65.1.1 AK\_add\_to\_redolog()

Function that adds a new element to redolog.

Author

Krunoslav Bilić updated by Dražen Bandić, second update by Tomislav Turek

Returns

EXIT\_FAILURE if not allocated memory for ispis, otherwise EXIT\_SUCCESS

# 7.65.1.2 AK\_add\_to\_redolog\_select()

Function that adds a new select to redolog, commented code with the new select from select.c, current code works with selection.c.

Author

Danko Bukovac

Returns

EXIT FAILURE if not allocated memory for ispis, otherwise EXIT SUCCESS

# 7.65.1.3 AK\_check\_attributes()

Function that checks if the attribute contains '|', and if it does it replaces it with "\|".

Author

Dražen Bandić

Returns

new attribute

#### 7.65.1.4 AK\_check\_redo\_log\_select()

Function that checks redolog for select, works only with selection.c, not select.c.

**Author** 

Danko Bukovac

Returns

0 if select was not found, otherwise 1

# 7.65.1.5 AK\_printout\_redolog()

```
void AK_printout_redolog ( )
```

Function that prints out the content of redolog memory.

Author

Krunoslav Bilić updated by Dražen Bandić, second update by Tomislav Turek

Returns

No return value.

### 7.65.1.6 AK\_redolog\_commit()

```
void AK redolog commit ( )
```

# 7.66 rel/aggregation.c File Reference

```
#include "aggregation.h"
Include dependency graph for aggregation.c:
```

### **Functions**

search\_result AK\_search\_unsorted (char \*szRelation, search\_params \*aspParams, int iNum\_search\_
params)

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_INTERVAL, TYPE\_PERIOD. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

• int AK\_header\_size (AK\_header \*header)

Function that calculates how many attributes there are in the header with a while loop.

void AK\_agg\_input\_init (AK\_agg\_input \*input)

Function that initializes the input object for aggregation with init values.

int AK\_agg\_input\_add (AK\_header header, int agg\_task, AK\_agg\_input \*input)

Function that adds a header with a task in input object for aggregation.

• int AK agg input add\_to\_beginning (AK\_header header, int agg\_task, AK\_agg\_input \*input)

Function that adds a header with a task on the beginning of the input object for aggregation. With the use of for loop existing attributes and tasks are moved from one place forward in input object.

void AK agg input fix (AK agg input \*input)

function that handles AVG (average) aggregation. It goes through array of tasks in input object until it comes to task with a value of -1. While loop examines whether the task in array is equal to AGG\_TASK\_AVG. If so, AGG\_TASK — \_AVG\_COUNT is put on the beginning of input object. After that, AGG\_TASK\_AVG\_SUM is put on the beginning of input object.

int AK\_aggregation (AK\_agg\_input \*input, char \*source\_table, char \*agg\_table)

Function that aggregates a given table by given attributes. Firstly, AGG\_TASK\_AVG\_COUNT and AGG\_TASK ← \_AVG\_SUM are put on the beginning of the input object. Then for loop iterates through input tasks and assignes the type of aggregation operation according to aggregation operation. New table has to be created. For loop goes through given table. GROUP operation is executed separately from other operations. Addresses of records are put in needed\_values array and results are put in new table.

• TestResult AK aggregation test ()

### 7.66.1 Detailed Description

Provides functions for aggregation and grouping

### 7.66.2 Function Documentation

# 7.66.2.1 AK\_agg\_input\_add()

Function that adds a header with a task in input object for aggregation.

#### **Author**

Dejan Frankovic

#### **Parameters**

header	a header that is being aggregated
agg_task	the task which is to be done on the header
input	the input object

#### Returns

On success, returns EXIT\_SUCCESS, otherwise EXIT\_FAILURE

# 7.66.2.2 AK\_agg\_input\_add\_to\_beginning()

Function that adds a header with a task on the beginning of the input object for aggregation. With the use of for loop existing attributes and tasks are moved from one place forward in input object.

### Author

Dejan Frankovic

# **Parameters**

header	a header that is being aggregated
agg_task	the task which is to be done on the header
input	the input object

### Returns

On success, returns EXIT\_SUCCESS, otherwise EXIT\_FAILURE

# 7.66.2.3 AK\_agg\_input\_fix()

function that handles AVG (average) aggregation. It goes through array of tasks in input object until it comes to task with a value of -1. While loop examines whether the task in array is equal to AGG\_TASK\_AVG. If so, AGG\_TAS — K\_AVG\_COUNT is put on the beginning of input object. After that, AGG\_TASK\_AVG\_SUM is put on the beginning of input object.

### Author

Dejan Frankovic

### **Parameters**

input the input	ıt object
-----------------	-----------

#### Returns

No return value

# 7.66.2.4 AK\_agg\_input\_init()

Function that initializes the input object for aggregation with init values.

#### **Author**

Dejan Frankovic

### **Parameters**

```
input the input object
```

#### Returns

No return value

# 7.66.2.5 AK\_aggregation()

```
char * source_table,
char * agg_table )
```

Function that aggregates a given table by given attributes. Firstly, AGG\_TASK\_AVG\_COUNT and AGG\_TASK ← \_AVG\_SUM are put on the beginning of the input object. Then for loop iterates through input tasks and assignes the type of aggregation operation according to aggregation operation. New table has to be created. For loop goes through given table. GROUP operation is executed separately from other operations. Addresses of records are put in needed values array and results are put in new table.

#### **Author**

Dejan Frankovic

#### **Parameters**

input	input object with list of atributes by which we aggregate and types of aggregations
source_table	- table name for the source table
agg_table	table name for aggregated table

#### Returns

EXIT\_SUCCESS if continues succesfuly, when not EXIT\_ERROR

THIS SINGLE LINE BELOW (memcpy) is the purpose of ALL evil in the world! This line is the reason why test function prints one extra empty row with "nulls" at the end! Trust me! Comment it, and you will see - test function will not print extra row with nulls (but counts and averages in table will be all messed up!) After two days of hard research, I still have not found what is the reason behind printing extra row at the end! Fellow programmer, if you really really want to solve this issue, arm yourself with at least 2 liters of hot coffee!

What this line does? What is the purpose of this line in the universe? Well, fellow programmer, this line sets the initial count to 1. That means if name "Ivan" is found, it will have count of 1 because, well, that's the first Ivan that is found! If function finds another Ivan (which, actually, will happen), this part of code will not handle it (other part of code will).

That actually means that this little piece of code (this line below) only (and ONLY) sets count to 1! And besides that causes every other evil in the world. :O

P.S. The reason for that may be in linked list, or in AK\_insert\_row() You'll have to check every piece of AKDB code to find cause! I have found out that additional line is added when k == 25. There may be problem in linked lists or in AK\_insert\_row function or somewhere else. Who knows.

If I didn't handle that last row (which has one attribute of size 0), test would not pass!

Good luck, fellow programmer!

# 7.66.2.6 AK\_aggregation\_test()

```
TestResult AK_aggregation_test ( )
```

checking results

This variable was added to handle bug described in this file.

### 7.66.2.7 AK\_header\_size()

Function that calculates how many attributes there are in the header with a while loop.

**Author** 

Dejan Frankovic

#### **Parameters**

header A header array	
-----------------------	--

#### Returns

Number of attributes defined in header array

# 7.66.2.8 AK\_search\_unsorted()

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_T  $\leftarrow$  IME, TYPE\_INTERVAL, TYPE\_PERIOD. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

Function that searches through unsorted values of multiple attributes in a segment. Only tuples that are equal on all given attribute values are returned (A == 1 AND B == 7 AND ...). SEARCH\_RANGE is inclusive. Only one value (or range) per attribute allowed - use search\_params.pData\_lower for SEARCH\_PARTICULAR. Supported types for SEARCH\_RANGE: TYPE\_INT, TYPE\_FLOAT, TYPE\_NUMBER, TYPE\_DATE, TYPE\_DATETIME, TYPE\_TI

ME. Do not provide the wrong data types in the array of search parameters. There is no way to test for that and it could cause a memory access violation.

### **Author**

Miroslav Policki

#### **Parameters**

szRelation	relation name
aspParams	array of search parameters
iNum_search_params	number of search parameters

#### Returns

search\_result structure defined in filesearch.h. Use AK\_deallocate\_search\_result to deallocate.

iterate through all the blocks

count number of attributes in segment/relation

determine index of attributes on which search will be performed

if any of the provided attributes are not found in the relation, return empty result

in every tuple, for all required attributes, compare attribute value with searched-for value and store matched tuple addresses

# 7.67 rel/aggregation.h File Reference

Include dependency graph for aggregation.h: This graph shows which files directly or indirectly include this file:

### **Classes**

struct AK\_agg\_value

Structure that contains atribute name, date and aggregation task associated.

struct AK\_agg\_input

Structure that contains attributes from table header, tasks for this table and counter value.

struct rowroot\_struct

Structure that defines a new row in table using list\_node.

struct projection\_att\_struct

Structure that defines projection\_att which is a new list\_node.

### **Macros**

- #define AGG\_TASK\_GROUP 1
- #define AGG\_TASK\_COUNT 2
- #define AGG\_TASK\_SUM 3
- #define AGG\_TASK\_MAX 4
- #define AGG TASK MIN 5
- #define AGG TASK AVG 6
- #define AGG\_TASK\_AVG\_COUNT 10
- #define AGG\_TASK\_AVG\_SUM 11

#### **Functions**

int AK header size (AK header \*)

Function that calculates how many attributes there are in the header with a while loop.

void AK\_agg\_input\_init (AK\_agg\_input \*input)

Function that initializes the input object for aggregation with init values.

int AK\_agg\_input\_add (AK\_header header, int agg\_task, AK\_agg\_input \*input)

Function that adds a header with a task in input object for aggregation.

• int AK agg input add to beginning (AK header header, int agg task, AK agg input \*input)

Function that adds a header with a task on the beginning of the input object for aggregation. With the use of for loop existing attributes and tasks are moved from one place forward in input object.

void AK\_agg\_input\_fix (AK\_agg\_input \*input)

function that handles AVG (average) aggregation. It goes through array of tasks in input object until it comes to task with a value of -1. While loop examines whether the task in array is equal to AGG\_TASK\_AVG. If so, AGG\_TASK — \_AVG\_COUNT is put on the beginning of input object. Number of attributes defined in header array

### 7.68 rel/difference.c File Reference

#include "difference.h"
Include dependency graph for difference.c:

#### **Functions**

void AK\_difference\_Print\_By\_Type (char \*data, int address, int size, int type, AK\_mem\_block \*tbl\_temp\_
 block)

Auxiliary function for printing data depending on the variable that enters the switch statement. Original code written by Dino Lakšatić, section separated and edited by Elena Kržina for code transparency.

• int AK\_difference (char \*srcTable1, char \*srcTable2, char \*dstTable)

Function that produces a difference of two tables. Table addresses are gotten by providing names of the tables. Specifically start addresses are taken from them. They are used to allocate blocks for them. It is checked whether the tables have same table schemas. If not, it returns EXIT\_ERROR. New segment for result of difference operation is initialized. Function compares every block in extent of the first table with every block in extent of second table. If there is a difference between their rows, they are put in dstTable.

• TestResult AK\_op\_difference\_test ()

Function for difference operator testing.

### 7.68.1 Detailed Description

Provides functions for relational difference operation

### 7.68.2 Function Documentation

### 7.68.2.1 AK\_difference()

Function that produces a difference of two tables. Table addresses are gotten by providing names of the tables. Specifically start addresses are taken from them. They are used to allocate blocks for them. It is checked whether the tables have same table schemas. If not, it returns EXIT\_ERROR. New segment for result of difference operation is initialized. Function compares every block in extent of the first table with every block in extent of second table. If there is a difference between their rows, they are put in dstTable.

Function that produces a difference of the two tables. Table addresses are get through names of tables. Specially start addresses are taken from them. They are used to allocate blocks for them. It is checked whether the tables have same table schemas. If not, it returns EXIT\_ERROR. New segment for result of difference operation is initialized. Function compares every block in extent of the first table with every block in extent of second table. If there is a difference between their rows, they are put in dstTable.

#### **Author**

Dino Laktašić; updated by Elena Kržina

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

#### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

### 7.68.2.2 AK\_difference\_Print\_By\_Type()

Auxiliary function for printing data depending on the variable that enters the switch statement. Original code written by Dino Lakšatić, section separated and edited by Elena Kržina for code transparency.

#### **Author**

Dino Laktašić edited by Elena Kržina

#### **Parameters**

data	accessed for later comparison
address	address of block for accessing data
size	size of block for accessing data
type	type of block for accessing data
tbl_temp_block	temporary block from which data is accessed

#### Returns

returns void

#### 7.68.2.3 AK\_op\_difference\_test()

```
TestResult AK_op_difference_test ( )
```

Function for difference operator testing.

#### **Author**

Dino Laktašić

## 7.70 rel/expression\_check.c File Reference

```
#include "expression_check.h"
Include dependency graph for expression_check.c:
```

#### **Functions**

- int AK check arithmetic statement (struct list node \*el, const char \*op, const char \*a, const char \*b)
  - Function that compares values according to their data type, checks arithmetic statement which is part of expression given in the function below. For every type of arithmetic operator, there is switch-case statement which examines type of el and casts void operands to this type.
- char \* AK\_replace\_wild\_card (const char \*s, char ch, const char \*repl)
  - Function that replaces character wildcard (%,\_) ch in string s with repl characters.
- char \* AK\_add\_start\_end\_regex\_chars (const char \*s)
  - Function that puts start and end charachters  $(^{\wedge},\$)$  on input string.
- int AK\_check\_regex\_expression (const char \*value, const char \*expression, int sensitive, int checkWildCard)

  Function that evaluates regex expression on a given string input.
- int AK\_check\_regex\_operator\_expression (const char \*value, const char \*expression)
  - Function that evaluates regex expression on a given string input.
- int AK\_check\_if\_row\_satisfies\_expression (struct list\_node \*row\_root, struct list\_node \*expr)
  - Function that evaluates whether one record (row) satisfies logical expression. It goes through given row. If it comes to logical operator, it evaluates by itself. For arithmetic operators function AK\_check\_arithmetic\_statement() is called.
- TestResult AK\_expression\_check\_test ()

### 7.70.1 Detailed Description

Provides functions for constraint checking used in selection and theta-join

#### 7.70.2 Function Documentation

### 7.70.2.1 AK\_add\_start\_end\_regex\_chars()

```
\begin{tabular}{ll} $\operatorname{char*}$ AK\_add\_start\_end\_regex\_chars ( \\ & \operatorname{const} \ \operatorname{char} \ * \ s \ ) \end{tabular}
```

Function that puts start and end charachters (^,\$) on input string.

@Author Fran Turković

#### **Parameters**

```
s input string
```

#### Returns

new sequence of charachters

### 7.70.2.2 AK\_check\_arithmetic\_statement()

```
int AK_check_arithmetic_statement (
    struct list_node * e1,
    const char * op,
    const char * a,
    const char * b )
```

Function that compares values according to their data type, checks arithmetic statement which is part of expression given in the function below. For every type of arithmetic operator, there is switch-case statement which examines type of el and casts void operands to this type.

Function that compares values according to their data type, checks arithmetic statement which is part of expression given in the function below.

#### **Author**

Dino Laktašić, abstracted by Tomislav Mikulček, updated by Nikola Miljancic, updated by Fran Turković

#### Parameters

el	list element, last element put in list temp which holds elements of row ordered according to expression and results of their evaluation
* <i>op</i>	comparison operator
*a	left operand
*b	right operand

#### Returns

0 if arithmetic statement is false, 1 if arithmetic statement is true

### 7.70.2.3 AK\_check\_if\_row\_satisfies\_expression()

Function that evaluates whether one record (row) satisfies logical expression. It goes through given row. If it comes to logical operator, it evaluates by itself. For arithmetic operators function AK\_check\_arithmetic\_statement() is called.

Function that replaces character wildcard (%,\_) ch in string s with repl characters.

### Author

Matija Šestak, updated by Dino Laktašić, Nikola Miljancic, abstracted by Tomislav Mikulček, updated by Fran Turković

#### **Parameters**

row_root	beginning of the row that is to be evaluated
*expr	list with the logical expression in postfix notation

#### Returns

0 if row does not satisfy, 1 if row satisfies expression

### 7.70.2.4 AK\_check\_regex\_expression()

Function that evaluates regex expression on a given string input.

@Author Leon Palaić, updated by Fran Turković

### **Parameters**

value	string value that must match regex expression
expression	POSIX regex expression
checkWildCard	replaces SQL wildcard to correesponding POSIX regex charachter
sensitive	case insensitive indicator 1-case sensitive,0- case insensitive
checkWildCard	0 if we don't need to replace wild charachters (regex case) 1 if we need to replace wild
	characters (LIKE case)

### Returns

0 if regex didnt match or sytnax of regex is incorecct 1 if string matches coresponding regex expression

## 7.70.2.5 AK\_check\_regex\_operator\_expression()

Function that evaluates regex expression on a given string input.

#### @Author Leon Palaić

#### **Parameters**

value	string value that must match regex expression
expression	POSIX regex expression

### Returns

0 if regex didnt match or sytnax of regex is incorecct 1 if string matches coresponding regex expression

### 7.70.2.6 AK\_expression\_check\_test()

```
TestResult AK_expression_check_test ( )
```

### 7.70.2.7 AK\_replace\_wild\_card()

Function that replaces character wildcard  $(\%,\_)$  ch in string s with repl characters.

## @Author Leon Palaić

s	input string
ch	charachter to be replaced

Returns

new sequence of charachters

## 7.71 rel/expression\_check.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/fileio.h"
#include "../auxi/mempro.h"
#include <regex.h>
```

Include dependency graph for expression\_check.h: This graph shows which files directly or indirectly include this file:

### **Functions**

- int AK\_check\_arithmetic\_statement (struct list\_node \*el, const char \*op, const char \*a, const char \*b)

  Function that compares values according to their data type, checks arithmetic statement which is part of expression given in the function below.
- int AK\_check\_if\_row\_satisfies\_expression (struct list\_node \*row\_root, struct list\_node \*expr)

  Function that replaces charachter wildcard (%,\_) ch in string s with repl characters.
- int AK\_check\_regex\_expression (const char \*value, const char \*expression, int sensitive, int checkWildCard)

  Function that evaluates regex expression on a given string input.
- int AK\_check\_regex\_operator\_expression (const char \*value, const char \*expression)

  Function that evaluates regex expression on a given string input.
- TestResult AK\_expression\_check\_test ()

## 7.71.1 Detailed Description

Header file that functions and defines for expression ckecking

### 7.71.2 Function Documentation

#### 7.71.2.1 AK\_check\_arithmetic\_statement()

```
int AK_check_arithmetic_statement (
    struct list_node * e1,
    const char * op,
    const char * a,
    const char * b )
```

Function that compares values according to their data type, checks arithmetic statement which is part of expression given in the function below.

Author

Dino Laktašić, abstracted by Tomislav Mikulček, updated by Nikola Miljancic

#### **Parameters**

el	list element, last element put in list temp which holds elements of row ordered according to expression	
	and results of their evaluation	
* <i>op</i>	comparison operator	
*a	left operand	
*b	right operand	

#### Returns

0 if arithmetic statement is false, 1 if arithmetic statement is true

Function that compares values according to their data type, checks arithmetic statement which is part of expression given in the function below.

### Author

Dino Laktašić, abstracted by Tomislav Mikulček, updated by Nikola Miljancic, updated by Fran Turković

#### **Parameters**

el	list element, last element put in list temp which holds elements of row ordered according to expression	
	and results of their evaluation	
* <i>op</i>	comparison operator	
*a	left operand	
*b	right operand	

#### Returns

0 if arithmetic statement is false, 1 if arithmetic statement is true

## 7.71.2.2 AK\_check\_if\_row\_satisfies\_expression()

Function that replaces character wildcard (%,\_) ch in string s with repl characters.

### @Author Leon Palaić

s	input string
ch	charachter to be replaced

#### Returns

new sequence of charachters

Function that replaces character wildcard (%,\_) ch in string s with repl characters.

#### **Author**

Matija Šestak, updated by Dino Laktašić, Nikola Miljancic, abstracted by Tomislav Mikulček, updated by Fran Turković

#### **Parameters**

row_root	beginning of the row that is to be evaluated
*expr	list with the logical expression in postfix notation

#### Returns

0 if row does not satisfy, 1 if row satisfies expression

### 7.71.2.3 AK\_check\_regex\_expression()

Function that evaluates regex expression on a given string input.

### @Author Leon Palaić

#### **Parameters**

value	string value that must match regex expression
expression	POSIX regex expression
checkWildCard	replaces SQL wildcard to correesponding POSIX regex charachter
sensitive	case insensitive indicator 1-case sensitive,0- case insensitive

### Returns

0 if regex didnt match or sytnax of regex is incorecct 1 if string matches coresponding regex expression

@Author Leon Palaić, updated by Fran Turković

value	string value that must match regex expression
-------	---

#### **Parameters**

expression	POSIX regex expression
checkWildCard	replaces SQL wildcard to correesponding POSIX regex charachter
sensitive	case insensitive indicator 1-case sensitive,0- case insensitive
checkWildCard	0 if we don't need to replace wild charachters (regex case) 1 if we need to replace wild characters (LIKE case)

### Returns

0 if regex didnt match or sytnax of regex is incorecct 1 if string matches coresponding regex expression

### 7.71.2.4 AK\_check\_regex\_operator\_expression()

Function that evaluates regex expression on a given string input.

#### @Author Leon Palaić

### **Parameters**

value	string value that must match regex expression
expression	POSIX regex expression

#### Returns

0 if regex didnt match or sytnax of regex is incorecct 1 if string matches coresponding regex expression

## 7.71.2.5 AK\_expression\_check\_test()

```
TestResult AK_expression_check_test ( )
```

## 7.72 rel/intersect.c File Reference

```
#include "intersect.h"
Include dependency graph for intersect.c:
```

### **Functions**

• int AK\_intersect (char \*srcTable1, char \*srcTable2, char \*dstTable)

Function that makes an intersect of two tables. Intersect is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (intersect)

TestResult AK\_op\_intersect\_test ()

Function for intersect operator testing.

## 7.72.1 Detailed Description

Provides functions for relational intersect operation

### 7.72.2 Function Documentation

### 7.72.2.1 AK\_intersect()

Function that makes an intersect of two tables. Intersect is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (intersect)

Function that makes a intersect of the two tables. Intersect is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (intersect)

#### **Author**

Dino Laktašić; updated by Elena Kržina

### Parameters

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

#### 7.72.2.2 AK\_op\_intersect\_test()

```
TestResult AK_op_intersect_test ( )
```

Function for intersect operator testing.

Author

Dino Laktašić

Returns

No return value

### 7.73 rel/intersect.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/fileio.h"
#include "../rec/archive_log.h"
#include "../auxi/mempro.h"
#include "../sql/drop.h"
```

Include dependency graph for intersect.h: This graph shows which files directly or indirectly include this file:

#### **Classes**

· struct intersect attr

Structure defines intersect attribute.

### **Functions**

• int AK\_intersect (char \*srcTable1, char \*srcTable2, char \*dstTable)

Function that makes a intersect of the two tables. Intersect is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (intersect)

• TestResult AK\_op\_intersect\_test ()

Function for intersect operator testing.

### 7.73.1 Detailed Description

Provides data structures, functions and defines for relational intersect operation

#### 7.73.2 Function Documentation

## 7.73.2.1 AK\_intersect()

Function that makes a intersect of the two tables. Intersect is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (intersect)

**Author** 

Dino Laktašić

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

#### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

Function that makes a intersect of the two tables. Intersect is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (intersect)

### Author

Dino Laktašić; updated by Elena Kržina

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

#### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

### 7.73.2.2 AK\_op\_intersect\_test()

```
TestResult AK_op_intersect_test ( )
```

Function for intersect operator testing.

### Author

Dino Laktašić

#### Returns

No return value

## 7.74 rel/nat\_join.c File Reference

```
#include "nat_join.h"
Include dependency graph for nat_join.c:
```

#### **Functions**

void AK\_create\_join\_block\_header (int table\_address1, int table\_address2, char \*new\_table, struct list\_node \*att)

Function that makes a header for the new table and call the function to create the segment.

void AK\_merge\_block\_join (struct list\_node \*row\_root, struct list\_node \*row\_root\_insert, AK\_block \*temp
 block, char \*new\_table)

Function that searches the second block and when found matches with the first one makes a join and writes a row to join the tables.

void AK\_copy\_blocks\_join (AK\_block \*tbl1\_temp\_block, AK\_block \*tbl2\_temp\_block, struct list\_node \*att, char \*new table)

Function that iterates through block of the first table and copies data that needs for join, then it calls a merge function to merge with the second table.

int AK\_join (char \*srcTable1, char \*srcTable2, char \*dstTable, struct list\_node \*att)

Function that makes a nat\_join betwen two tables on some attributes.

TestResult AK\_op\_join\_test ()

Function for natural join testing.

## 7.74.1 Detailed Description

Provides functions for relational natural join operation

#### 7.74.2 Function Documentation

### 7.74.2.1 AK\_copy\_blocks\_join()

```
void AK_copy_blocks_join (
          AK_block * tbl1_temp_block,
          AK_block * tbl2_temp_block,
          struct list_node * att,
          char * new_table )
```

Function that iterates through block of the first table and copies data that needs for join, then it calls a merge function to merge with the second table.

#### Author

Matija Novak, optimized, and updated to work with AK list by Dino Laktašić

tbl1_temp_block	block of the first table
tbl2_temp_block	block of the second join table
att	attributes on which we make nat_join
new_table	name of the nat_join table

#### Returns

No return value

### 7.74.2.2 AK\_create\_join\_block\_header()

Function that makes a header for the new table and call the function to create the segment.

#### Author

Matija Novak, optimized, and updated to work with AK\_list by Dino Laktašić

#### **Parameters**

table_address1	address of the block of the first table
table_address2	address of the block of the second table
new_table	name of the join table
att_root	ttributes on which we make nat_join

#### Returns

No return value

## 7.74.2.3 AK\_join()

Function that makes a nat\_join betwen two tables on some attributes.

### Author

Matija Novak, updated to work with AK\_list and support cacheing by Dino Laktašić

srcTable1	name of the first table to join
srcTable2	name of the second table to join
att	attributes on which we make nat_join
dstTable	name of the nat_join table

#### Returns

if success returns EXIT\_SUCCESS

### 7.74.2.4 AK\_merge\_block\_join()

```
void AK_merge_block_join (
          struct list_node * row_root,
          struct list_node * row_root_insert,
          AK_block * temp_block,
          char * new_table )
```

Function that searches the second block and when found matches with the first one makes a join and writes a row to join the tables.

### Author

Matija Novak, updated by Dino Laktašić

### **Parameters**

row_root	- list of values from the first table to be marged with table2
row_root_insert	- list of values from the first table to be inserted into nat_join table
temp_block	- block from the second table to be merged
new_table	- name of the nat_join table

## Returns

No return value

## 7.74.2.5 AK\_op\_join\_test()

```
TestResult AK_op_join_test ( )
```

Function for natural join testing.

#### Author

Matija Novak

### Returns

No return value

## 7.75 rel/nat join.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/fileio.h"
#include "../rel/projection.h"
#include "../auxi/mempro.h"
#include "../sql/drop.h"
```

Include dependency graph for nat join.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

void AK\_create\_join\_block\_header (int table\_address1, int table\_address2, char \*new\_table, struct list\_node \*att)

Function that makes a header for the new table and call the function to create the segment.

void AK\_merge\_block\_join (struct list\_node \*row\_root, struct list\_node \*row\_root\_insert, AK\_block \*temp
block, char \*new table)

Function that searches the second block and when found matches with the first one makes a join and writes a row to join the tables.

void AK\_copy\_blocks\_join (AK\_block \*tbl1\_temp\_block, AK\_block \*tbl2\_temp\_block, struct list\_node \*att, char \*new table)

Function that iterates through block of the first table and copies data that needs for join, then it calls a merge function to merge with the second table.

• int AK join (char \*srcTable1, char \*srcTable2, char \*dstTable, struct list node \*att)

Function that makes a nat\_join betwen two tables on some attributes.

TestResult AK\_op\_join\_test ()

Function for natural join testing.

### 7.75.1 Detailed Description

Header file that provides functions and defines for relational natural join operation

#### 7.75.2 Function Documentation

### 7.75.2.1 AK\_copy\_blocks\_join()

```
void AK_copy_blocks_join (
          AK_block * tbl1_temp_block,
          AK_block * tbl2_temp_block,
          struct list_node * att,
          char * new_table )
```

Function that iterates through block of the first table and copies data that needs for join, then it calls a merge function to merge with the second table.

Author

Matija Novak, optimized, and updated to work with AK\_list by Dino Laktašić

#### **Parameters**

tbl1_temp_block	block of the first table
tbl2_temp_block	block of the second join table
att	attributes on which we make nat_join
new_table	name of the nat_join table

### Returns

No return value

### 7.75.2.2 AK\_create\_join\_block\_header()

```
void AK_create_join_block_header (
    int table_address1,
    int table_address2,
    char * new_table,
    struct list_node * att )
```

Function that makes a header for the new table and call the function to create the segment.

#### **Author**

Matija Novak, optimized, and updated to work with AK\_list by Dino Laktašić

### **Parameters**

table_address1	address of the block of the first table
table_address2	address of the block of the second table
new_table	name of the join table
att_root	ttributes on which we make nat_join

### Returns

No return value

## 7.75.2.3 AK\_join()

Function that makes a nat\_join betwen two tables on some attributes.

#### Author

Matija Novak, updated to work with AK\_list and support cacheing by Dino Laktašić

#### **Parameters**

srcTable1	name of the first table to join
srcTable2	name of the second table to join
att	attributes on which we make nat_join
dstTable	name of the nat_join table

### Returns

if success returns EXIT\_SUCCESS

### 7.75.2.4 AK\_merge\_block\_join()

```
void AK_merge_block_join (
          struct list_node * row_root,
          struct list_node * row_root_insert,
          AK_block * temp_block,
          char * new_table )
```

Function that searches the second block and when found matches with the first one makes a join and writes a row to join the tables.

### Author

Matija Novak, updated by Dino Laktašić

### Parameters

row_root	- list of values from the first table to be marged with table2
row_root_insert	- list of values from the first table to be inserted into nat_join table
temp_block	- block from the second table to be merged
new_table	- name of the nat_join table

#### Returns

No return value

## 7.75.2.5 AK\_op\_join\_test()

```
TestResult AK_op_join_test ( )
```

Function for natural join testing.

**Author** 

Matija Novak

Returns

No return value

## 7.76 rel/product.c File Reference

```
#include "product.h"
Include dependency graph for product.c:
```

### **Functions**

- int AK\_product (char \*srcTable1, char \*srcTable2, char \*dstTable)
  - Function that makes the structure of an empty destination table for product operation.
- void AK\_product\_procedure (char \*srcTable1, char \*srcTable2, char \*dstTable, AK\_header header[MAX\_ATTRIBUTES])

  Functions that iterates trough both tables and concates rows comparing headers and their row values.
- TestResult AK\_op\_product\_test ()

Function for product operator testing, where it is given 2 source table on which product operations are managed.

## 7.76.1 Detailed Description

Provides functions for relational product operation

#### 7.76.2 Function Documentation

#### 7.76.2.1 AK\_op\_product\_test()

```
TestResult AK_op_product_test ( )
```

Function for product operator testing, where it is given 2 source table on which product operations are managed.

Author

Dino Laktašić, Fabijan Josip Kraljić

#### Returns

Product destination table and number od passed tests.

Test result - number of successful and unsuccessful tests.

### 7.76.2.2 AK\_product()

Function that makes the structure of an empty destination table for product operation.

#### **Author**

Dino Laktašić

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the product table

### Returns

Created destination table as a result of product operation if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

## 7.76.2.3 AK\_product\_procedure()

Functions that iterates trough both tables and concates rows comparing headers and their row values.

Functions that iterates trough both tables and concates rows. The result is in destination table.

#### **Author**

Dino Laktašić, Fabijan Josip Kraljić

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the product table

#### Returns

destination table filled with data sized n(rows srcTable1)\*m(rows srcTable2)

#### **Parameters**

header header of product	table
--------------------------	-------

Product procedure Going through one table, and for each row in it, going through another table, and joining rows that way!

## 7.77 rel/product.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/files.h"
#include "../auxi/mempro.h"
#include "../sql/drop.h"
```

Include dependency graph for product.h: This graph shows which files directly or indirectly include this file:

### **Functions**

- int AK\_product (char \*srcTable1, char \*srcTable2, char \*dstTable)

  Function that makes the structure of an empty destination table for product operation.
- void AK\_product\_procedure (char \*srcTable1, char \*srcTable2, char \*dstTable, AK\_header header[MAX\_ATTRIBUTES])

  Functions that iterates trough both tables and concates rows. The result is in destination table.
- TestResult AK\_op\_product\_test ()

Function for product operator testing, where it is given 2 source table on which product operations are managed.

### 7.77.1 Detailed Description

Header file that provides functions and defines for relational product operation

### 7.77.2 Function Documentation

### 7.77.2.1 AK\_op\_product\_test()

```
TestResult AK_op_product_test ( )
```

Function for product operator testing, where it is given 2 source table on which product operations are managed.

### **Author**

Dino Laktašić, Fabijan Josip Kraljić

### Returns

Product destination table and number od passed tests.

Test result - number of successful and unsuccessful tests.

### 7.77.2.2 AK\_product()

Function that makes the structure of an empty destination table for product operation.

#### **Author**

Dino Laktašić

## **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the product table

### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

#### **Author**

Dino Laktašić

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the product table

### Returns

Created destination table as a result of product operation if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

## 7.77.2.3 AK\_product\_procedure()

Functions that iterates trough both tables and concates rows. The result is in destination table.

### **Author**

Dino Laktašić, Fabijan Josip Kraljić

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the product table
header	header of product table

Functions that iterates trough both tables and concates rows. The result is in destination table.

#### **Author**

Dino Laktašić, Fabijan Josip Kraljić

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the product table

#### Returns

destination table filled with data sized n(rows srcTable1)\*m(rows srcTable2)

#### **Parameters**

Product procedure Going through one table, and for each row in it, going through another table, and joining rows that way!

## 7.78 rel/projection.c File Reference

#include "projection.h"
Include dependency graph for projection.c:

### **Functions**

void AK\_create\_block\_header (int old\_block, char \*dstTable, struct list\_node \*att)

Function that creates a new header for the projection table.

char \* AK\_get\_operator (char \*exp)

Function that fetches arithmetic operator from given expression string, determinates given operator so it can be used for aritmetic operations.

void AK\_remove\_substring (char \*s, const char \*substring)

Function that iterates through given string and removes specified part of that string.

• int AK determine header type (int firstOperand, int secondOperand)

Function that determines the new header type.

char \* AK\_create\_header\_name (char \*first, char \*second, char \*operator)

Function that creates new header name from passed operand names and operator.

void AK\_copy\_block\_projection (AK\_block \*old\_block, struct list\_node \*att, char \*dstTable, struct list\_node \*expr)

Function that copies the data from old table block to the new projection table.

char \* AK\_perform\_operation (char \*op, struct AK\_operand \*firstOperand, struct AK\_operand \*second
 —
 Operand, int type)

Function that performes arithmetics operation depended on given operator.

int AK projection (char \*srcTable, char \*dstTable, struct list node \*att, struct list node \*expr)

Function that makes a projection of some table on given attributes.

• TestResult AK\_op\_projection\_test ()

Function for projection operation testing, tests usual projection functionality, projection when it is given aritmetic operation or expresson.

### 7.78.1 Detailed Description

Provides functions for relational projection operation

#### 7.78.2 Function Documentation

### 7.78.2.1 AK\_copy\_block\_projection()

```
void AK_copy_block_projection (
          AK_block * old_block,
          struct list_node * att,
          char * dstTable,
          struct list_node * expr )
```

Function that copies the data from old table block to the new projection table.

#### **Author**

Matija Novak, rewritten and optimized by Dino Laktašić to support AK\_list

#### **Parameters**

old_block	block from which we copy data	
dstTable	name of the new table	
att	list of the attributes which should the projection table contain	
expr	given expression to check	

### Returns

New projection table that contains all blocks from old table No return value

### 7.78.2.2 AK\_create\_block\_header()

Function that creates a new header for the projection table.

#### **Author**

Matija Novak, rewritten and optimized by Dino Laktašić to support AK\_list

#### **Parameters**

old_block_add	address of the block from which we copy headers we need
dstTable	name of the new table - destination table
att	list of the attributes which should the projection table contain

#### Returns

Newly created header

No return value

### 7.78.2.3 AK\_create\_header\_name()

Function that creates new header name from passed operand names and operator.

### Author

Leon Palaić

#### **Parameters**

first	operand name
second	operand name
operator	given operator

### Returns

Function returns set of characters that represent new header name Character - new name

### 7.78.2.4 AK\_determine\_header\_type()

Function that determines the new header type.

**Author** 

Leon Palaić

### **Parameters**

firstOperand	operand type
secondOperand	operand type

#### Returns

Function returns determinated header type Integer - type

### 7.78.2.5 AK\_get\_operator()

Function that fetches arithmetic operator from given expression string, determinates given operator so it can be used for aritmetic operations.

Author

Leon Palaić

### **Parameters**

```
exp input expression string
```

### Returns

character - aritmetic operator character

### 7.78.2.6 AK\_op\_projection\_test()

```
TestResult AK_op_projection_test ( )
```

Function for projection operation testing, tests usual projection functionality, projection when it is given aritmetic operation or expresson.

### Author

Dino Laktašić, rewritten and optimized by Irena Ilišević to support ILIKE operator and perform usual projection

#### Returns

Projection tables and number od passed tests

Test result - number of successful and unsuccessful tests

### 7.78.2.7 AK\_perform\_operation()

Function that performes arithmetics operation depended on given operator.

#### **Author**

Leon Palaić

#### **Parameters**

firstOperand	first operand
secondOperand	second operand
ор	aritmetic operator
type	type of operand

### Returns

result of arithmetic operation character

### 7.78.2.8 AK\_projection()

```
char * dstTable,
struct list_node * att,
struct list_node * expr )
```

Function that makes a projection of some table on given attributes.

### Author

Matija Novak, rewritten and optimized by Dino Laktašić, now support cacheing

#### **Parameters**

srcTable	source table - table on which projection is made	
expr	given expression to check while doing projection	
att	list of atributes on which we make projection	
dstTable	table name for projection table - new table - destination table	

### Returns

Projection table on given attributes

EXIT\_SUCCESS if continues successfuly, when not EXIT\_ERROR

## 7.78.2.9 AK\_remove\_substring()

```
void AK_remove_substring ( \label{eq:char} \mbox{char} \ * \ s, \mbox{const char} \ * \ substring \ )
```

Function that iterates through given string and removes specified part of that string.

### Author

Leon Palaić

### **Parameters**

s	input string
substring	string that needs to be removed

### Returns

Cleaned new string

No return value

# 7.79 rel/projection.h File Reference

```
#include "../auxi/test.h"
```

```
#include "expression_check.h"
#include "../file/table.h"
#include "../file/fileio.h"
#include "../auxi/mempro.h"
```

Include dependency graph for projection.h: This graph shows which files directly or indirectly include this file:

#### **Classes**

struct AK\_operand

#### **Functions**

void AK create block header (int old block, char \*dstTable, struct list node \*att)

Function that creates a new header for the projection table.

char \* AK\_get\_operator (char \*exp)

Function that fetches arithmetic operator from given expression string, determinates given operator so it can be used for aritmetic operations.

void AK\_remove\_substring (char \*s, const char \*substring)

Function that iterates through given string and removes specified part of that string.

• int AK\_determine\_header\_type (int firstOperand, int secondOperand)

Function that determines the new header type.

char \* AK\_create\_header\_name (char \*first, char \*operator, char \*second)

Function that creates new header name from passed operand names and operator.

void AK\_copy\_block\_projection (AK\_block \*old\_block, struct list\_node \*att, char \*dstTable, struct list\_node \*expr)

Function that copies the data from old table block to the new projection table.

Function that performes arithmetics operation depended on given operator.

• int AK projection (char \*srcTable, char \*dstTable, struct list node \*att, struct list node \*expr)

Function that makes a projection of some table on given attributes.

TestResult AK\_op\_projection\_test ()

Function for projection operation testing, tests usual projection functionality, projection when it is given aritmetic operation or expresson.

### 7.79.1 Detailed Description

Header file that provides data structures, functions and defines for relational projection operation

### 7.79.2 Function Documentation

### 7.79.2.1 AK\_copy\_block\_projection()

```
void AK_copy_block_projection (
          AK_block * old_block,
          struct list_node * att,
          char * dstTable,
          struct list_node * expr )
```

Function that copies the data from old table block to the new projection table.

### Author

Matija Novak, rewritten and optimized by Dino Laktašić to support AK\_list

#### **Parameters**

old_block	block from which we copy data
dstTable	name of the new table
att	list of the attributes which should the projection table contain
expr	given expression to check

#### Returns

New projection table that contains all blocks from old table No return value

### 7.79.2.2 AK\_create\_block\_header()

```
void AK_create_block_header (
    int old_block,
    char * dstTable,
    struct list_node * att )
```

Function that creates a new header for the projection table.

#### **Author**

Matija Novak, rewritten and optimized by Dino Laktašić to support AK\_list

old_block_add	address of the block from which we copy headers we need
dstTable	name of the new table - destination table
att	list of the attributes which should the projection table contain

#### Returns

Newly created header

No return value

### 7.79.2.3 AK\_create\_header\_name()

Function that creates new header name from passed operand names and operator.

### Author

Leon Palaić

#### **Parameters**

first	operand name
second	operand name
operator	given operator

### Returns

Function returns set of characters that represent new header name

Character - new name

### 7.79.2.4 AK\_determine\_header\_type()

Function that determines the new header type.

### Author

Leon Palaić

firstOperand	operand type
secondOperand	operand type

#### Returns

```
Function returns determinated header type 
Integer - type
```

### 7.79.2.5 AK\_get\_operator()

Function that fetches arithmetic operator from given expression string, determinates given operator so it can be used for aritmetic operations.

### Author

Leon Palaić

### **Parameters**

exp	input expression string
-----	-------------------------

#### Returns

```
character - aritmetic operator character
```

### **Author**

Leon Palaić

#### **Parameters**

```
exp input expression string
```

## Returns

```
character - aritmetic operator character
```

### 7.79.2.6 AK\_op\_projection\_test()

```
TestResult AK_op_projection_test ( )
```

Function for projection operation testing, tests usual projection functionality, projection when it is given aritmetic operation or expresson.

#### Author

Dino Laktašić, rewritten and optimized by Irena Ilišević to support ILIKE operator and perform usual projection

#### Returns

Projection tables and number od passed tests

Test result - number of successful and unsuccessful tests

#### 7.79.2.7 AK\_perform\_operation()

Function that performes arithmetics operation depended on given operator.

#### Author

Leon Palaić

### **Parameters**

firstOperand	first operand	
secondOperand	second operand	
ор	aritmetic operator	
type	type of operand	

## Returns

result of arithmetic operation character

# 7.79.2.8 AK\_projection()

Function that makes a projection of some table on given attributes.

# Author

Matija Novak, rewritten and optimized by Dino Laktašić, now support cacheing

#### **Parameters**

srcTable	source table - table on which projection is made	
expr	given expression to check while doing projection	
att	list of atributes on which we make projection	
dstTable	table name for projection table - new table - destination table	

## Returns

Projection table on given attributes

EXIT\_SUCCESS if continues succesfuly, when not EXIT\_ERROR

# 7.79.2.9 AK\_remove\_substring()

```
void AK_remove_substring ( \label{eq:char} \mbox{char} \ * \ s, \mbox{const char} \ * \ substring \ )
```

Function that iterates through given string and removes specified part of that string.

#### Author

Leon Palaić

## **Parameters**

s	input string
substring	string that needs to be removed

#### Returns

Cleaned new string

No return value

# 7.80 rel/selection.c File Reference

```
#include "selection.h"
Include dependency graph for selection.c:
```

## **Functions**

- int AK\_selection (char \*srcTable, char \*dstTable, struct list\_node \*expr) Function that which implements selection.
- TestResult AK\_op\_selection\_test ()

Function for selection operator testing using WHERE clause and operators BETWEEN, AND.

TestResult AK\_op\_selection\_test\_pattern ()

Function for selection operator testing using operators LIKE, ILIKE, SIMILAR TO.

• int AK\_selection\_op\_rename (char \*srcTable, char \*dstTable, struct list\_node \*expr)

Function that which implements selection rename operation test.

# 7.80.1 Detailed Description

Provides functions for relational selection operation

# 7.80.2 Function Documentation

# 7.80.2.1 AK\_op\_selection\_test()

```
TestResult AK_op_selection_test ( )
```

Function for selection operator testing using WHERE clause and operators BETWEEN, AND.

**Author** 

Matija Šestak, updated by Dino Laktašić, Nikola Miljancic

## 7.80.2.2 AK\_op\_selection\_test\_pattern()

```
TestResult AK_op_selection_test_pattern ( )
```

Function for selection operator testing using operators LIKE, ILIKE, SIMILAR TO.

Author

Krunoslav Bilić updated by Filip Belinić

## 7.80.2.3 AK\_selection()

Function that which implements selection.

**Author** 

Matija Šestak, updated by Elena Kržina

#### **Parameters**

*srcTable	source table name
*dstTable	destination table name
*expr	list with posfix notation of the logical expression

## Returns

EXIT\_SUCCESS

# 7.80.2.4 AK\_selection\_op\_rename()

Function that which implements selection rename operation test.

#### **Author**

unknown

#### **Parameters**

*srcTable	source table name
*dstTable	destination table name
*expr	list with posfix notation of the logical expression

### Returns

EXIT\_SUCCESS

# 7.81 rel/selection.h File Reference

```

## **Functions**

- int AK\_selection (char \*srcTable, char \*dstTable, struct list\_node \*expr) Function that which implements selection.
- TestResult AK\_op\_selection\_test ()

Function for selection operator testing using WHERE clause and operators BETWEEN, AND.

TestResult AK op selection test pattern ()

Function for selection operator testing using operators LIKE, ILIKE, SIMILAR TO.

# 7.81.1 Detailed Description

Header file that provides functions and defines for relational selection operation

#### 7.81.2 Function Documentation

# 7.81.2.1 AK\_op\_selection\_test()

```
TestResult AK_op_selection_test ( )
```

Function for selection operator testing using WHERE clause and operators BETWEEN, AND.

**Author** 

Matija Šestak, updated by Dino Laktašić, Nikola Miljancic

# 7.81.2.2 AK\_op\_selection\_test\_pattern()

```
TestResult AK_op_selection_test_pattern ( )
```

Function for selection operator testing using operators LIKE, ILIKE, SIMILAR TO.

Author

Krunoslav Bilić updated by Filip Belinić

#### 7.81.2.3 AK\_selection()

Function that which implements selection.

Author

Matija Šestak.

#### **Parameters**

*srcTable	source table name
*dstTable	destination table name
*expr	list with posfix notation of the logical expression

#### Returns

**EXIT SUCCESS** 

#### **Author**

Matija Šestak, updated by Elena Kržina

#### **Parameters**

*srcTable	source table name
*dstTable	destination table name
*expr	list with posfix notation of the logical expression

#### Returns

EXIT\_SUCCESS

# 7.82 rel/theta\_join.c File Reference

#include "theta\_join.h"
Include dependency graph for theta\_join.c:

## **Functions**

- int AK\_create\_theta\_join\_header (char \*srcTable1, char \*srcTable2, char \*new\_table)

  Function that creates a header of the new table for theta join.
- void AK\_check\_constraints (AK\_block \*tbl1\_temp\_block, AK\_block \*tbl2\_temp\_block, int tbl1\_num\_att, int tbl2 num att, struct list\_node \*constraints, char \*new\_table)

Function that iterates through blocks of the two tables and copies the rows which pass the constraint check into the new table.

• int AK\_theta\_join (char \*srcTable1, char \*srcTable2, char \*dstTable, struct list\_node \*constraints)

Function that creates a theta join betwen two tables on specified conditions. Names of the attibutes in the constraints parameter must be prefixed with the table name followed by a dot if and only if they exist in both tables. This is left for the preprocessing. Also, for now the constraints

must come from the two source tables and not from a third.

· TestResult AK op theta join test ()

Function for testing the theta join.

## 7.82.1 Detailed Description

Provides functions for relational theta join operation

# 7.82.2 Function Documentation

# 7.82.2.1 AK\_check\_constraints()

```
void AK_check_constraints (
          AK_block * tbl1_temp_block,
          AK_block * tbl2_temp_block,
          int tbl1_num_att,
          int tbl2_num_att,
          struct list_node * constraints,
          char * new_table )
```

Function that iterates through blocks of the two tables and copies the rows which pass the constraint check into the new table.

**Author** 

Tomislav Mikulček

#### **Parameters**

tbl1_temp_block	block of the first table
tbl2_temp_block	block of the second join table
tbl1_num_att	number of attributes in the first table
tbl2_num_att	number of attributes in the second table
constraints	list of attributes, (in)equality and logical operators which are the conditions for the join in postfix notation
new_table	name of the theta_join table

## Returns

No return value

# 7.82.2.2 AK\_create\_theta\_join\_header()

Function that creates a header of the new table for theta join.

## Author

Tomislav Mikulček

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
new_table	name of the destination table

#### Returns

EXIT\_SUCCESS if the header was successfully created and EXIT\_ERROR if the renamed headers are too long

## 7.82.2.3 AK\_op\_theta\_join\_test()

```
TestResult AK_op_theta_join_test ( )
```

Function for testing the theta join.

**Author** 

Tomislav Mikulček

Returns

No return value

## 7.82.2.4 AK\_theta\_join()

Function that creates a theta join betwen two tables on specified conditions. Names of the attibutes in the constraints parameter must be prefixed with the table name followed by a dot if and only if they exist in both tables. This is left for the preprocessing. Also, for now the constraints must come from the two source tables and not from a third.

Function that creates a theta join betwen two tables on specified conditions.

Author

Tomislav Mikulček, updated by Nikola Miljancic

#### **Parameters**

srcTable1	name of the first table to join
srcTable2	name of the second table to join
constraints	list of attributes, (in)equality and logical operators which are the conditions for the join in postfix notation
dstTable	name of the theta join table

#### Returns

if successful returns EXIT\_SUCCESS and EXIT\_ERROR otherwise

# 7.83 rel/theta\_join.h File Reference

```
#include "../auxi/test.h"
#include "expression_check.h"
#include "../file/fileio.h"
#include "../auxi/mempro.h"
```

Include dependency graph for theta\_join.h: This graph shows which files directly or indirectly include this file:

## **Functions**

- int AK\_theta\_join (char \*srcTable1, char \*srcTable2, char \*dstTable, struct list\_node \*constraints)

  Function that creates a theta join betwen two tables on specified conditions.
- int AK\_create\_theta\_join\_header (char \*srcTable1, char \*srcTable2, char \*new\_table)

Function that creates a header of the new table for theta join.

• void AK\_check\_constraints (AK\_block \*tbl1\_temp\_block, AK\_block \*tbl2\_temp\_block, int tbl1\_num\_att, int tbl2\_num\_att, struct list\_node \*constraints, char \*new\_table)

Function that iterates through blocks of the two tables and copies the rows which pass the constraint check into the new table.

• TestResult AK\_op\_theta\_join\_test ()

Function for testing the theta join.

# 7.83.1 Detailed Description

Header file that provides functions and defines for theta-join

## 7.83.2 Function Documentation

# 7.83.2.1 AK\_check\_constraints()

```
void AK_check_constraints (
          AK_block * tbl1_temp_block,
          AK_block * tbl2_temp_block,
          int tbl1_num_att,
          int tbl2_num_att,
          struct list_node * constraints,
          char * new_table )
```

Function that iterates through blocks of the two tables and copies the rows which pass the constraint check into the new table.

## **Author**

Tomislav Mikulček

#### **Parameters**

tbl1_temp_block	block of the first table
tbl2_temp_block	block of the second join table
tbl1_num_att	number of attributes in the first table
tbl2_num_att	number of attributes in the second table
constraints	list of attributes, (in)equality and logical operators which are the conditions for the join in postfix notation
new_table	name of the theta_join table

#### Returns

No return value

# 7.83.2.2 AK\_create\_theta\_join\_header()

Function that creates a header of the new table for theta join.

### Author

Tomislav Mikulček

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
new_table	name of the destination table

#### Returns

EXIT\_SUCCESS if the header was successfully created and EXIT\_ERROR if the renamed headers are too long

## 7.83.2.3 AK\_op\_theta\_join\_test()

```
TestResult AK_op_theta_join_test ( )
```

Function for testing the theta join.

Author

Tomislav Mikulček

Returns

No return value

# 7.83.2.4 AK\_theta\_join()

Function that creates a theta join betwen two tables on specified conditions.

Author

Tomislav Mikulček, updated by Nikola Miljancic

#### **Parameters**

srcTable1	name of the first table to join
srcTable2	name of the second table to join
constraints	list of attributes, (in)equality and logical operators which are the conditions for the join in postfix notation
dstTable	name of the theta join table

#### Returns

if successful returns EXIT\_SUCCESS and EXIT\_ERROR otherwise

Function that creates a theta join betwen two tables on specified conditions.

#### **Author**

Tomislav Mikulček, updated by Nikola Miljancic

#### **Parameters**

srcTable1	name of the first table to join
srcTable2	name of the second table to join
constraints	list of attributes, (in)equality and logical operators which are the conditions for the join in postfix notation
dstTable	name of the theta join table

#### Returns

if successful returns EXIT SUCCESS and EXIT ERROR otherwise

# 7.84 rel/union.c File Reference

#include "union.h"
Include dependency graph for union.c:

# **Functions**

• int AK\_union (char \*srcTable1, char \*srcTable2, char \*dstTable)

Function that makes a union of two tables. Union is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (union)

 void AK\_Write\_Segments (char \*dstTable, int num\_att, table\_addresses \*src\_addr1, int startAddress1, AK\_mem\_block \*tbl1\_temp\_block, struct list\_node \*row\_root)

Auxiliary function for writing blocks or tables into new segment, made by Dino Laktašić originally and separated and edited by Elena Kržina for code transparency.

• TestResult AK\_op\_union\_test ()

Function for union operator testing.

# 7.84.1 Detailed Description

Provides functions for relational union operation

# 7.84.2 Function Documentation

## 7.84.2.1 AK\_op\_union\_test()

```
TestResult AK_op_union_test ( )
```

Function for union operator testing.

Author

Dino Laktašić

Returns

No return value

# 7.84.2.2 AK\_union()

Function that makes a union of two tables. Union is implemented for working with multiple sets of data, i.e. duplicate tuples can be written in same table (union)

Function that makes a union of two tables.

**Author** 

Dino Laktašić; updated by Elena Kržina

## **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

## Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

# 7.84.2.3 AK\_Write\_Segments()

```
table_addresses * src_addr1,
int startAddress1,
AK_mem_block * tbl1_temp_block,
struct list_node * row_root )
```

Auxiliary function for writing blocks or tables into new segment, made by Dino Laktašić originally and separated and edited by Elena Kržina for code transparency.

#### **Author**

Dino Laktašić edited by Elena Kržina

#### **Parameters**

dstTable	destination table of function
num_att	number of attributes of table
src_addr1	source address
startAddress1	starting address
tbl1_temp_block	table block that is accessed
row_root	root of linked list

#### Returns

void

# 7.85 rel/union.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/fileio.h"

Returns

No return value

# 7.85.2.2 AK\_union()

Function that makes a union of two tables.

**Author** 

Dino Laktašić

## **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

#### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

Function that makes a union of two tables.

**Author** 

Dino Laktašić; updated by Elena Kržina

#### **Parameters**

srcTable1	name of the first table
srcTable2	name of the second table
dstTable	name of the new table

#### Returns

if success returns EXIT\_SUCCESS, else returns EXIT\_ERROR

# 7.86 sql/command.c File Reference

```
#include "command.h"
Include dependency graph for command.c:
```

#### **Functions**

int AK\_command (command \*commands, int commandNum)
 Function for executing given commands (SELECT, UPDATE, DELETE AND INSERT)

• TestResult AK\_test\_command ()

Function for testing commands.

# 7.88 sql/cs/between.c File Reference

```
#include "between.h"
Include dependency graph for between.c:
```

#### **Functions**

- int AK\_find\_table\_address (char \*\_systemTableName)
  - Function that returns system tables addresses by name.
- void AK\_set\_constraint\_between (char \*tableName, char \*constraintName, char \*attName, char \*startValue, char \*endValue)

Function that sets between constraints on particular attribute, string constraint should be writen in lowercase. It searches for AK\_free space. Then it inserts id, name of table, name of constraint, name of attribute, start and end value in temporary block.

• int AK\_read\_constraint\_between (char \*tableName, char \*newValue, char \*attNamePar)

Function that checks if the given value is between lower and upper bounds of the "between" constraint.

void AK\_print\_constraints (char \*tableName)

Function for printing tables.

• int AK\_delete\_constraint\_between (char \*tableName, char \*constraintNamePar)

Function for deleting specific between constraint.

TestResult AK\_constraint\_between\_test ()

Function that tests the functionality of implemented between constraint.

# 7.88.1 Detailed Description

Provides functions for between constaint

#### 7.88.2 Function Documentation

## 7.88.2.1 AK\_constraint\_between\_test()

```
TestResult AK_constraint_between_test ( )
```

Function that tests the functionality of implemented between constraint.

Author

Saša Vukšić, updated by Mislav Jurinić, updated by Blaž Rajič

Returns

No return value

## 7.88.2.2 AK delete constraint between()

Function for deleting specific between constraint.

Author

Maja Vračan

## **Parameters**

tableName	name of table on which constraint refers
attName	name of attribute on which constraint is declared
constraintName	name of constraint

#### Returns

EXIT\_SUCCESS when constraint is deleted, else EXIT\_ERROR

# 7.88.2.3 AK\_find\_table\_address()

Function that returns system tables addresses by name.

Author

Mislav Jurinić

#### **Parameters**

_systemTableName	table name

Returns

int

# 7.88.2.4 AK\_print\_constraints()

Function for printing tables.

**Author** 

Maja Vračan

## **Parameters**

tableName	name of table

## 7.88.2.5 AK\_read\_constraint\_between()

Function that checks if the given value is between lower and upper bounds of the "between" constraint.

#### **Author**

Saša Vukšić, updated by Mislav Jurinić, updated by Blaž Rajič

#### **Parameters**

tableName	table name
newValue	value we want to insert
attNamePar	attribute name in table

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.88.2.6 AK\_set\_constraint\_between()

Function that sets between constraints on particular attribute, string constraint should be writen in lowercase. It searches for AK\_free space. Then it inserts id, name of table, name of constraint, name of attribute, start and end value in temporary block.

Function that sets between constraints on particular attribute, string constraint should be writen in lowercase.

### **Author**

Saša Vukšić, updated by Mislav Jurinić, updated by Blaž Rajič

### **Parameters**

tableName	table name
constraintName	name of constraint
Generated by Doxygen allName	name of attribute
startValue	initial constraint
endValue	final constraint

Returns

No return value

# 7.89 sql/cs/between.h File Reference

```
#include "../../auxi/test.h"

• int AK\_find\_table\_address (char \*\_systemTableName)

Function that returns system tables addresses by name.

void AK\_set\_constraint\_between (char \*tableName, char \*constraintName, char \*attName, char \*startValue, char \*endValue)

Function that sets between constraints on particular attribute, string constraint should be writen in lowercase.

• int AK\_read\_constraint\_between (char \*tableName, char \*newValue, char \*attNamePar)

Function that checks if the given value is between lower and upper bounds of the "between" constraint.

• int AK\_delete\_constraint\_between (char \*tableName, char \*constraintName)

Function for deleting specific between constraint.

TestResult AK\_constraint\_between\_test ()

Function that tests the functionality of implemented between constraint.

# 7.89.1 Detailed Description

Header file that provides functions and defines for between constaint

### 7.89.2 Function Documentation

### 7.89.2.1 AK\_constraint\_between\_test()

```
TestResult AK_constraint_between_test ( )
```

Function that tests the functionality of implemented between constraint.

**Author** 

Saša Vukšić, updated by Mislav Jurinić, updated by Blaž Rajič

Returns

No return value

# 7.89.2.2 AK\_delete\_constraint\_between()

Function for deleting specific between constraint.

## Author

Maja Vračan, updated by Blaž Rajič

#### **Parameters**

tableName	name of table on which constraint refers
attName	name of attribute on which constraint is declared
constraintName	name of constraint

## Returns

EXIT\_SUCCESS when constraint is deleted, else EXIT\_ERROR

#### **Author**

Maja Vračan

#### **Parameters**

tableName	name of table on which constraint refers
attName	name of attribute on which constraint is declared
constraintName	name of constraint

## Returns

EXIT\_SUCCESS when constraint is deleted, else EXIT\_ERROR

# 7.89.2.3 AK\_find\_table\_address()

Function that returns system tables addresses by name.

## Author

Mislav Jurinić

## **Parameters**

_systemTableName t	able name
--------------------	-----------

# Returns

int

# 7.89.2.4 AK\_read\_constraint\_between()

Function that checks if the given value is between lower and upper bounds of the "between" constraint.

#### **Author**

Saša Vukšić, updated by Mislav Jurinić

#### **Parameters**

tableName	table name
newValue	value we want to insert
attNamePar	attribute name

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

#### **Author**

Saša Vukšić, updated by Mislav Jurinić, updated by Blaž Rajič

#### **Parameters**

tableName	table name
newValue	value we want to insert
attNamePar	attribute name in table

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.89.2.5 AK\_set\_constraint\_between()

Function that sets between constraints on particular attribute, string constraint should be writen in lowercase.

#### Author

Saša Vukšić, updated by Mislav Jurinić

#### **Parameters**

tableName table name	
constraintName	name of constraint
attName	name of attribute
startValue	initial constraint
endValue	final constraint

## Returns

No return value

Function that sets between constraints on particular attribute, string constraint should be writen in lowercase.

# Author

Saša Vukšić, updated by Mislav Jurinić, updated by Blaž Rajič

#### **Parameters**

tableName	table name
constraintName	name of constraint
attName	name of attribute
startValue initial constraint	
endValue	final constraint

## Returns

No return value

# 7.90 sql/cs/check\_constraint.c File Reference

```
#include "check_constraint.h"
```

```
#include "../drop.h"
Include dependency graph for check_constraint.c:
```

## **Functions**

• int condition\_passed (char \*condition, int type, void \*value, void \*row\_data)

Function that for a given value, checks if it satisfies the "check" constraint.

int AK\_set\_check\_constraint (char \*table\_name, char \*constraint\_name, char \*attribute\_name, char \*condition, int type, void \*value)

Function that adds a new "check" constraint into the system table.

• int AK\_check\_constraint (char \*table, char \*attribute, void \*value)

Function that verifies if the value we want to insert satisfies the "check" constraint.

• int AK\_delete\_check\_constraint (char \*tableName, char \*constraintName)

Function that deletes existing check constraint.

TestResult AK\_check\_constraint\_test ()

Test function for "check" constraint.

## 7.90.1 Detailed Description

Check constraint implementation file.

## 7.90.2 Function Documentation

## 7.90.2.1 AK\_check\_constraint()

Function that verifies if the value we want to insert satisfies the "check" constraint.

#### **Author**

Mislav Jurinić

#### **Parameters**

table	target table name
attribute	target attribute name
value	data we want to insert

#### Returns

```
1 - result, 0 - failure
```

## 7.90.2.2 AK\_check\_constraint\_test()

```
TestResult AK_check_constraint_test ( )
```

Test function for "check" constraint.

**Author** 

Mislav Jurinić, updated by Bruno Pilošta

Returns

void

# 7.90.2.3 AK\_delete\_check\_constraint()

Function that deletes existing check constraint.

Function that verifies if the value we want to insert satisfies the "check" constraint.

**Author** 

Bruno Pilošta

## **Parameters**

tableName	System table where constraint will be deleted from
constraintName	Name of the constraint that will be deleted

# Returns

```
1 - result, 0 - failure
```

## 7.90.2.4 AK\_set\_check\_constraint()

```
char * attribute_name,
char * condition,
int type,
void * value )
```

Function that adds a new "check" constraint into the system table.

## **Author**

Mislav Jurinić

## **Parameters**

table_name	target table for "check" constraint evaluation
constraint_name	new "check" constraint name that will be visible in the system table
attribute_name	target attribute for "check" constraint evaluation
condition	logical operator ['<', '>', '!=',]
type	data type [int, float, varchar, datetime,]
value	condition to be set

#### Returns

```
1 - result, 0 - failure
```

# 7.90.2.5 condition\_passed()

Function that for a given value, checks if it satisfies the "check" constraint.

### **Author**

Mislav Jurinić

## **Parameters**

condition	logical operator ['<', '>', '!=',]
type	data type [int, float, varchar, datetime,]
value	condition to be set
row_data	data in table

## Returns

```
1 - result, 0 - failure
```

# 7.91 sql/cs/check constraint.h File Reference

```

Include dependency graph for check\_constraint.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

• int condition\_passed (char \*condition, int type, void \*value, void \*row\_data)

Function that for a given value, checks if it satisfies the "check" constraint.

 int AK\_set\_check\_constraint (char \*table\_name, char \*constraint\_name, char \*attribute\_name, char \*condition, int type, void \*value)

Function that adds a new "check" constraint into the system table.

• int AK\_delete\_check\_constraint (char \*tableName, char \*constraintName)

Function that verifies if the value we want to insert satisfies the "check" constraint.

TestResult AK\_check\_constraint\_test ()

Test function for "check" constraint.

## 7.91.1 Detailed Description

Header file that provides functions and defines for check constraint

#### 7.91.2 Function Documentation

## 7.91.2.1 AK\_check\_constraint\_test()

Test function for "check" constraint.

```
TestResult AK_check_constraint_test ( )
```

Author

Mislav Jurinić, updated by Bruno Pilošta

Returns

void

# 7.91.2.2 AK\_delete\_check\_constraint()

Function that verifies if the value we want to insert satisfies the "check" constraint.

Author

Mislav Jurinić

#### **Parameters**

table	target table name
attribute	target attribute name
value	data we want to insert

# Returns

```
1 - result, 0 - failure
```

Function that verifies if the value we want to insert satisfies the "check" constraint.

#### **Author**

Bruno Pilošta

## **Parameters**

tableName	System table where constraint will be deleted from
constraintName	Name of the constraint that will be deleted

#### Returns

```
1 - result, 0 - failure
```

# 7.91.2.3 AK\_set\_check\_constraint()

Function that adds a new "check" constraint into the system table.

#### Author

Mislav Jurinić

#### **Parameters**

table_name	target table for "check" constraint evaluation
constraint_name	new "check" constraint name that will be visible in the system table
attribute_name	target attribute for "check" constraint evaluation
condition	logical operator ['<', '>', '!=',]
type	data type [int, float, varchar, datetime,]
value	condition to be set

#### Returns

```
1 - result, 0 - failure
```

## 7.91.2.4 condition\_passed()

Function that for a given value, checks if it satisfies the "check" constraint.

#### **Author**

Mislav Jurinić

#### **Parameters**

condition	logical operator ['<', '>', '!=',]
type	data type [int, float, varchar, datetime,]
value	condition to be set
row_data	data in table

## Returns

```
1 - result, 0 - failure
```

# 7.92 sql/cs/constraint\_names.c File Reference

#include "constraint_names.h"
Include dependency graph for constraint_names.c:
```

## **Functions**

- int AK\_check\_constraint\_name (char \*constraintName, char \*constraintTable)
- TestResult AK\_constraint\_names\_test ()

Function that tests if constraint name would be unique in database.

Function that checks if constraint name would be unique in database.

# 7.92.1 Detailed Description

Provides functions for checking if constraint name is unique in database

## 7.92.2 Function Documentation

## 7.92.2.1 AK\_check\_constraint\_name()

Function that checks if constraint name would be unique in database.

#### **Author**

Nenad Makar, updated by Matej Lipovača, updated by Marko Belusic

#### **Parameters**

constraintName	constraintName name which you want to give to constraint which you are trying to create
constraintTable	name of the constraint table you want to seach, put NULL if you want to seach all constraint
	tables

#### Returns

```
EXIT_ERROR or EXIT_SUCCESS
```

Updated by Matej Lipovača Added other constraint names from catalog, aswell in "constants.h"

# 7.92.2.2 AK\_constraint\_names\_test()

```
TestResult AK_constraint_names_test ( )
```

Function that tests if constraint name would be unique in database.

## **Author**

Nenad Makar

#### Returns

No return value

# 7.93 sql/cs/constraint\_names.h File Reference

```
#include "../../auxi/test.h"
#include "../../file/table.h"
#include "../../file/fileio.h"
#include "../../auxi/mempro.h"
```

Include dependency graph for constraint\_names.h: This graph shows which files directly or indirectly include this file:

## **Functions**

• int AK\_check\_constraint\_name (char \*constraintName, char \*constraintTable)

Function that checks if constraint name would be unique in database.

TestResult AK\_constraint\_names\_test ()

Function that tests if constraint name would be unique in database.

# 7.93.1 Detailed Description

Header file that provides functions and defines for checking if constraint name is unique in database

#### 7.93.2 Function Documentation

## 7.93.2.1 AK\_check\_constraint\_name()

Function that checks if constraint name would be unique in database.

Author

Nenad Makar, updated by Mislav Jurinić

#### **Parameters**

char constraintName name which you want to give to constraint which you are trying to create

Returns

EXIT\_ERROR or EXIT\_SUCCESS

Author

Nenad Makar, updated by Matej Lipovača, updated by Marko Belusic

#### **Parameters**

constraintName	constraintName name which you want to give to constraint which you are trying to create
constraintTable	name of the constraint table you want to seach, put NULL if you want to seach all constraint
	tables

Returns

```
EXIT_ERROR or EXIT_SUCCESS
```

Updated by Matej Lipovača Added other constraint names from catalog, aswell in "constants.h"

## 7.93.2.2 AK\_constraint\_names\_test()

```
TestResult AK_constraint_names_test ( )
```

Function that tests if constraint name would be unique in database.

**Author** 

Nenad Makar

Returns

No return value

# 7.94 sql/cs/nnull.c File Reference

```
#include "nnull.h"
Include dependency graph for nnull.c:
```

## **Functions**

- int AK\_set\_constraint\_not\_null (char \*tableName, char \*attName, char \*constraintName)

  Function that sets NOT NULL constraint on an attribute.
- int AK\_check\_constraint\_not\_null (char \*tableName, char \*attName, char \*constraintName)

  Function that checks if constraint name is unique and in violation of NOT NULL constraint.
- int AK\_read\_constraint\_not\_null (char \*tableName, char \*attName, char \*newValue)
   Function checks if NOT NULL constraint is already set.
- int AK\_delete\_constraint\_not\_null (char \*tableName, char \*constraintName)

  Function for deleting not null constraints.
- T another deleting not named orientality
- TestResult AK\_nnull\_constraint\_test ()

Function for testing NOT NULL constraint.

## 7.94.1 Detailed Description

Provides functions for not null constraint

### 7.94.2 Function Documentation

## 7.94.2.1 AK\_check\_constraint\_not\_null()

Function that checks if constraint name is unique and in violation of NOT NULL constraint.

#### **Author**

Saša Vukšić, updated by Nenad Makar

#### **Parameters**

char*	tableName name of table
char*	attName name of attribute
char*	constraintName name of constraint

#### Returns

EXIT\_ERROR or EXIT\_SUCCESS

## 7.94.2.2 AK\_delete\_constraint\_not\_null()

Function for deleting not null constraints.

Function for deleting specific not null constraint.

## Author

Bruno Pilošta

#### **Parameters**

tableName	System table where constraint will be deleted from
constraintName	Name of constraint that will be deleted

## Returns

EXIT\_SUCCESS if the constraint is deleted, EXIT\_ERROR otherwise

# 7.94.2.3 AK\_nnull\_constraint\_test()

```
TestResult AK_nnull_constraint_test ( )
```

Function for testing NOT NULL constraint.

Author

Saša Vukšić, updated by Nenad Makar, updated by Tea Jelavić

#### Returns

No return value

## 7.94.2.4 AK\_read\_constraint\_not\_null()

Function checks if NOT NULL constraint is already set.

**Author** 

Saša Vukšić, updated by Nenad Makar

#### **Parameters**

char*	tableName name of table
char*	attName name of attribute
char*	newValue new value

#### Returns

EXIT\_ERROR or EXIT\_SUCCESS

## 7.94.2.5 AK\_set\_constraint\_not\_null()

Function that sets NOT NULL constraint on an attribute.

Saša Vukšić, updated by Nenad Makar

#### **Parameters**

char*	tableName name of table
char*	attName name of attribute
char*	constraintName name of constraint

### Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.95 sql/cs/nnull.h File Reference

```
#include "../../auxi/test.h"
#include "../../file/table.h"
#include "../../file/fileio.h"
#include "../../auxi/mempro.h"
#include "constraint_names.h"
```

Include dependency graph for nnull.h: This graph shows which files directly or indirectly include this file:

## **Functions**

- int AK\_set\_constraint\_not\_null (char \*tableName, char \*attName, char \*constraintName)

  Function that sets NOT NULL constraint on an attribute.
- int AK\_read\_constraint\_not\_null (char \*tableName, char \*attName, char \*newValue) Function checks if NOT NULL constraint is already set.
- int AK\_check\_constraint\_not\_null (char \*tableName, char \*attName, char \*newValue)
   Function that checks if constraint name is unique and in violation of NOT NULL constraint.
- int AK\_delete\_constraint\_not\_null (char \*tableName, char \*constraintName)

Function for deleting specific not null constraint.

TestResult AK\_nnull\_constraint\_test ()

Function for testing NOT NULL constraint.

## 7.95.1 Detailed Description

Header file that provides functions and defines for not null constraint

### 7.95.2 Function Documentation

## 7.95.2.1 AK\_check\_constraint\_not\_null()

Function that checks if constraint name is unique and in violation of NOT NULL constraint.

**Author** 

Saša Vukšić, updated by Nenad Makar

### **Parameters**

char*	tableName name of table
char*	attName name of attribute
char*	constraintName name of constraint

### Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.95.2.2 AK\_delete\_constraint\_not\_null()

Function for deleting specific not null constraint.

## **Author**

Maja Vračan

## **Parameters**

tableName	name of table on which constraint refers name of attribute on which constraint is declared	
attName		
constraintName	name of constraint	

## Returns

EXIT\_SUCCESS when constraint is deleted, else EXIT\_ERROR

Function for deleting specific not null constraint.

## Author

Bruno Pilošta

## **Parameters**

tableName	System table where constraint will be deleted from
constraintName	Name of constraint that will be deleted

## Returns

EXIT\_SUCCESS if the constraint is deleted, EXIT\_ERROR otherwise

## 7.95.2.3 AK\_nnull\_constraint\_test()

```
TestResult AK_nnull_constraint_test ( )
```

Function for testing NOT NULL constraint.

Author

Saša Vukšić, updated by Nenad Makar, updated by Tea Jelavić

Returns

No return value

# 7.95.2.4 AK\_read\_constraint\_not\_null()

Function checks if NOT NULL constraint is already set.

Author

Saša Vukšić, updated by Nenad Makar

## **Parameters**

char*	tableName name of table
char*	attName name of attribute
char*	newValue new value

Returns

EXIT\_ERROR or EXIT\_SUCCESS

### 7.95.2.5 AK\_set\_constraint\_not\_null()

Function that sets NOT NULL constraint on an attribute.

#### **Author**

Saša Vukšić, updated by Nenad Makar

### **Parameters**

char*	tableName name of table
char*	attName name of attribute
char*	constraintName name of constraint

### Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.96 sql/cs/reference.c File Reference

#include "reference.h"
Include dependency graph for reference.c:

### **Functions**

int AK\_add\_reference (char \*childTable, char \*childAttNames[], char \*parentTable, char \*parentAttNames[], int attNum, char \*constraintName, int type)

Function that adds a reference for a group of attributes over a given table to a group of attributes over another table with a given constraint name.

AK\_ref\_item AK\_get\_reference (char \*tableName, char \*constraintName)

Function that reads a reference entry from system table.

• int AK\_reference\_check\_attribute (char \*tableName, char \*attribute, char \*value)

Function that checks referential integrity for one attribute.

• int AK\_reference\_check\_if\_update\_needed (struct list\_node \*lista, int action)

Function that quickly checks if there are any referential constraints that should be applied on a given list of changes.

int AK\_reference\_check\_restricion (struct list\_node \*lista, int action)

Function that checks for a REF\_TYPE\_RESTRICT references appliable to the operation of updating or deleting a row in a table.

• int AK\_reference\_update (struct list\_node \*lista, int action)

Function that updates child table entries according to ongoing update of parent table entries.

• int AK\_reference\_check\_entry (struct list\_node \*lista)

Function that checks a new entry for referential integrity.

TestResult AK\_reference\_test ()

Function for testing referential integrity.

## 7.96.1 Detailed Description

Provides functions for referential integrity

## 7.96.2 Function Documentation

# 7.96.2.1 AK\_add\_reference()

Function that adds a reference for a group of attributes over a given table to a group of attributes over another table with a given constraint name.

## Author

Dejan Frankovic

### **Parameters**

name	of the child table
array	of child table attribute names (foreign key attributes)
name	of the parent table
array	of parent table attribute names (primary key attributes)
number	of attributes in foreign key
name	of the constraint
type	of the constraint, constants defined in 'reference.h'

# Returns

EXIT\_SUCCESS

# 7.96.2.2 AK\_get\_reference()

Function that reads a reference entry from system table.

## Author

Dejan Frankovic

name	of the table with reference (with foreign key)
name	of the reference constraint

### Returns

AK\_ref\_item object with all neccessary information about the reference

# 7.96.2.3 AK\_reference\_check\_attribute()

Function that checks referential integrity for one attribute.

### **Author**

Dejan Frankovic

### **Parameters**

child	hild table name	
attribute	name (foreign key attribute)	
value	of the attribute we're checking	

## Returns

EXIT ERROR if check failed, EXIT\_SUCCESS if referential integrity is ok

# 7.96.2.4 AK\_reference\_check\_entry()

Function that checks a new entry for referential integrity.

## Author

Dejan Franković

list	of elements for insert row

### Returns

EXIT\_SUCCESS if referential integrity is ok, EXIT\_ERROR if it is compromised

# 7.96.2.5 AK\_reference\_check\_if\_update\_needed()

Function that quickly checks if there are any referential constraints that should be applied on a given list of changes.

## Author

Dejan Frankovic

### **Parameters**

1	ist	of elements for update
i	s	action UPDATE or DELETE?

## Returns

EXIT\_SUCCESS if update is needed, EXIT\_ERROR if not

# 7.96.2.6 AK\_reference\_check\_restricion()

Function that checks for a REF\_TYPE\_RESTRICT references appliable to the operation of updating or deleting a row in a table.

## **Author**

Dejan Franković

list	of elements for update
is	action UPDATE or DELETE?

Returns

EXIT\_SUCCESS if there is no restriction on this action, EXIT\_ERROR if there is

# 7.96.2.7 AK\_reference\_test()

```
TestResult AK_reference_test ( )
```

Function for testing referential integrity.

Author

Dejan Franković

Returns

No return value

## 7.96.2.8 AK\_reference\_update()

Function that updates child table entries according to ongoing update of parent table entries.

Author

Dejan Franković

### **Parameters**

list	of elements for update
is	action UPDATE or DELETE?

Returns

EXIT\_SUCCESS

# 7.97 sql/cs/reference.h File Reference

```
#include "../../auxi/test.h"
#include "../../dm/dbman.h"
```

```
#include "../../file/table.h"
#include "../../auxi/mempro.h"
```

Include dependency graph for reference.h: This graph shows which files directly or indirectly include this file:

### Classes

· struct AK ref item

Structure that represents reference item. It contains of table, attributes, parent table and it's attributes, number of attributes, constraint and type of reference.

## **Macros**

• #define REF TYPE NONE -1

Constant declaring none reference type.

#define REF\_TYPE\_SET\_NULL 1

Constant declaring set null reference type.

#define REF TYPE NO ACTION 2

Constant declaring no action reference type.

- #define REF TYPE CASCADE 3
- #define REF TYPE RESTRICT 4

Constant declaring restrict reference type.

#define REF\_TYPE\_SET\_DEFAULT 5

Constant declaring set default reference type.

#define MAX REFERENCE ATTRIBUTES 10

Constant declaring maximum number of reference attributes.

#define MAX\_CHILD\_CONSTRAINTS 20

Constant declaring maximum number of child constraints.

## **Functions**

• int AK\_add\_reference (char \*childTable, char \*childAttNames[], char \*parentTable, char \*parentAttNames[], int attNum, char \*constraintName, int type)

Function that adds a reference for a group of attributes over a given table to a group of attributes over another table with a given constraint name.

• AK\_ref\_item AK\_get\_reference (char \*tableName, char \*constraintName)

Function that reads a reference entry from system table.

• int AK\_reference\_check\_attribute (char \*tableName, char \*attribute, char \*value)

Function that checks referential integrity for one attribute.

• int AK\_reference\_check\_if\_update\_needed (struct list\_node \*lista, int action)

Function that quickly checks if there are any referential constraints that should be applied on a given list of changes.

• int AK\_reference\_check\_restricion (struct list\_node \*lista, int action)

Function that checks for a REF\_TYPE\_RESTRICT references appliable to the operation of updating or deleting a row in a table.

• int AK reference update (struct list node \*lista, int action)

Function that updates child table entries according to ongoing update of parent table entries.

int AK\_reference\_check\_entry (struct list\_node \*lista)

Function that checks a new entry for referential integrity.

• TestResult AK\_reference\_test ()

Function for testing referential integrity.

 void AK\_Insert\_New\_Element (int newtype, void \*data, char \*table, char \*attribute\_name, struct list\_node \*ElementBefore)

Used to add a new element after some element, to insert on first place give list as before element. It calls function AK\_Insert\_New\_Element\_For\_Update.

• void AK\_Update\_Existing\_Element (int newtype, void \*data, char \*table, char \*attribute\_name, struct list node \*ElementBefore)

Used to add a constraint attribute which will define what element gets updated when the operation is executed.

int AK\_insert\_row (struct list\_node \*row\_root)

Function inserts a one row into table. Firstly it is checked whether inserted row would violite reference integrity. Then it is checked in which table should row be inserted. If there is no AK\_free space for new table, new extent is allocated. New block is allocated on given address. Row is inserted in this block and dirty flag is set to BLOCK\_DIRTY.

• int AK\_selection (char \*srcTable, char \*dstTable, struct list\_node \*expr)

Function that which implements selection.

 void AK\_Insert\_New\_Element\_For\_Update (int newtype, void \*data, char \*table, char \*attribute\_name, struct list\_node \*ElementBefore, int newconstraint)

!! YOU PROBABLY DON'T WANT TO USE THIS FUNCTION!! - Use AK\_Update\_Existing\_Element or AK\_Insert 
\_\_New\_Element instead. Function inserts new element after some element, to insert on first place give list as before element. New element is allocated. Type, data, attribute name and constraint of new elemets are set according to function arguments. Pointers are changed so that before element points to new element.

int AK\_delete\_row (struct list\_node \*row\_root)

Function deletes rows.

int AK\_update\_row (struct list\_node \*row\_root)

Function updates rows of some table.

• int AK\_initialize\_new\_segment (char \*name, int type, AK\_header \*header)

Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.

## 7.97.1 Detailed Description

đ Provides data structures, functions and defines for referential integrity

### 7.97.2 Macro Definition Documentation

## 7.97.2.1 MAX CHILD CONSTRAINTS

#define MAX\_CHILD\_CONSTRAINTS 20

Constant declaring maximum number of child constraints.

## 7.97.2.2 MAX\_REFERENCE\_ATTRIBUTES

#define MAX\_REFERENCE\_ATTRIBUTES 10

Constant declaring maximum number of reference attributes.

# 7.97.2.3 REF\_TYPE\_CASCADE

```
#define REF_TYPE_CASCADE 3
```

# 7.97.2.4 REF\_TYPE\_NO\_ACTION

```
#define REF_TYPE_NO_ACTION 2
```

Constant declaring no action reference type.

Constant declaring cascade reference type.

# 7.97.2.5 REF\_TYPE\_NONE

```
#define REF_TYPE_NONE -1
```

Constant declaring none reference type.

## 7.97.2.6 REF\_TYPE\_RESTRICT

```
#define REF_TYPE_RESTRICT 4
```

Constant declaring restrict reference type.

# 7.97.2.7 REF\_TYPE\_SET\_DEFAULT

```
#define REF_TYPE_SET_DEFAULT 5
```

Constant declaring set default reference type.

# 7.97.2.8 REF\_TYPE\_SET\_NULL

```
#define REF_TYPE_SET_NULL 1
```

Constant declaring set null reference type.

# 7.97.3 Function Documentation

# 7.97.3.1 AK\_add\_reference()

Function that adds a reference for a group of attributes over a given table to a group of attributes over another table with a given constraint name.

# Author

Dejan Frankovic

## **Parameters**

name	of the child table
array	of child table attribute names (foreign key attributes)
name	of the parent table
array	of parent table attribute names (primary key attributes)
number	of attributes in foreign key
name	of the constraint
type	of the constraint, constants defined in 'reference.h'

## Returns

EXIT\_SUCCESS

# 7.97.3.2 AK\_delete\_row()

Function deletes rows.

# Author

Matija Novak, Dejan Frankovic (added referential integrity)

row_roo	elements of one row @returs EXIT_SUCCESS if success
---------	---

# 7.97.3.3 AK\_get\_reference()

Function that reads a reference entry from system table.

Author

Dejan Frankovic

### **Parameters**

na	ame	of the table with reference (with foreign key)
na	ame	of the reference constraint

### Returns

AK\_ref\_item object with all neccessary information about the reference

# 7.97.3.4 AK\_initialize\_new\_segment()

Function that initializes a new segment and writes its start and finish address in system catalog table. For creting new table, index, temporary table, etc. call this function.

**Author** 

Tomislav Fotak, updated by Matija Šestak (function now uses caching)

## **Parameters**

name	segment name
type	segment type
header	pointer to header that should be written to the new extent (all blocks)

### Returns

start address of new segment

## 7.97.3.5 AK\_Insert\_New\_Element()

Used to add a new element after some element, to insert on first place give list as before element. It calls function AK\_Insert\_New\_Element\_For\_Update.

### **Author**

Matija Novak, changed by Dino Laktašić

### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	is NEW_VALUE

### Returns

No return value

## 7.97.3.6 AK\_Insert\_New\_Element\_For\_Update()

```
void AK_Insert_New_Element_For_Update (
    int newtype,
    void * data,
    char * table,
    char * attribute_name,
    struct list_node * ElementBefore,
    int newconstraint )
```

!! YOU PROBABLY DON'T WANT TO USE THIS FUNCTION!! - Use AK\_Update\_Existing\_Element or AK\_Insert ← \_New\_Element instead. Function inserts new element after some element, to insert on first place give list as before element. New element is allocated. Type, data, attribute name and constraint of new elements are set according to function arguments. Pointers are changed so that before element points to new element.

## **Author**

Matija Novak

### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	NEW_VALUE if data is new value, SEARCH_CONSTRAINT if data is constraint to search for

### Returns

No return value

## 7.97.3.7 AK\_insert\_row()

Function inserts a one row into table. Firstly it is checked whether inserted row would violite reference integrity. Then it is checked in which table should row be inserted. If there is no AK\_free space for new table, new extent is allocated. New block is allocated on given address. Row is inserted in this block and dirty flag is set to BLOCK\_
DIRTY.

## **Author**

Matija Novak, updated by Matija Šestak (function now uses caching), updated by Dejan Frankovic (added reference check), updated by Dino Laktašić (removed variable AK\_free, variable table initialized using memset), updated by Josip Šušnjara (chained blocks support)

## **Parameters**

row_root	list of elements which contain data of one row
----------	--

## Returns

EXIT\_SUCCESS if success else EXIT\_ERROR

## 7.97.3.8 AK\_reference\_check\_attribute()

Function that checks referential integrity for one attribute.

## Author

Dejan Frankovic

### **Parameters**

child	table name
attribute	name (foreign key attribute)
value	of the attribute we're checking

## Returns

EXIT ERROR if check failed, EXIT\_SUCCESS if referential integrity is ok

# 7.97.3.9 AK\_reference\_check\_entry()

Function that checks a new entry for referential integrity.

### **Author**

Dejan Franković

### **Parameters**

list of elements f	or insert row
--------------------	---------------

### Returns

EXIT\_SUCCESS if referential integrity is ok, EXIT\_ERROR if it is compromised

# 7.97.3.10 AK\_reference\_check\_if\_update\_needed()

Function that quickly checks if there are any referential constraints that should be applied on a given list of changes.

## Author

Dejan Frankovic

list	of elements for update
is	action UPDATE or DELETE?

### Returns

EXIT\_SUCCESS if update is needed, EXIT\_ERROR if not

# 7.97.3.11 AK\_reference\_check\_restricion()

Function that checks for a REF\_TYPE\_RESTRICT references appliable to the operation of updating or deleting a row in a table.

### **Author**

Dejan Franković

### **Parameters**

list	of elements for update
is	action UPDATE or DELETE?

## Returns

EXIT\_SUCCESS if there is no restriction on this action, EXIT\_ERROR if there is

## 7.97.3.12 AK\_reference\_test()

```
TestResult AK_reference_test ( )
```

Function for testing referential integrity.

**Author** 

Dejan Franković

Returns

No return value

## 7.97.3.13 AK\_reference\_update()

Function that updates child table entries according to ongoing update of parent table entries.

**Author** 

Dejan Franković

### **Parameters**

list	of elements for update
is	action UPDATE or DELETE?

### Returns

EXIT\_SUCCESS

## 7.97.3.14 AK\_selection()

Function that which implements selection.

### Author

Matija Šestak, updated by Elena Kržina

## **Parameters**

*srcTable	source table name
*dstTable	destination table name
*expr	list with posfix notation of the logical expression

# Returns

EXIT\_SUCCESS

# 7.97.3.15 AK\_Update\_Existing\_Element()

```
void AK_Update_Existing_Element (
    int newtype,
    void * data,
    char * table,
    char * attribute_name,
    struct list_node * ElementBefore )
```

Used to add a constraint attribute which will define what element gets updated when the operation is executed.

## Author

Igor Rinkovec

### **Parameters**

newtype	type of the data
data	the data
table	table name
attribute_name	attribute name
element	element after we which insert the new element
constraint	is NEW_VALUE

### Returns

No return value

### 7.97.3.16 AK\_update\_row()

Function updates rows of some table.

### **Author**

Matija Novak, Dejan Frankovic (added referential integrity)

### **Parameters**

row_root	elements of one row

## Returns

EXIT\_SUCCESS if success

# 7.98 sql/cs/unique.c File Reference

```
#include "unique.h"
Include dependency graph for unique.c:
```

# **Functions**

- int AK\_set\_constraint\_unique (char \*tableName, char attName[], char constraintName[]) Function that sets unique constraint on attribute(s)
- int AK\_read\_constraint\_unique (char \*tableName, char attName[], char newValue[])

  Function that checks if the insertion of some value(s) would violate the UNIQUE constraint.
- int AK\_delete\_constraint\_unique (char \*tableName, char \*constraintName)

Function for deleting specific unique constraint.

TestResult AK\_unique\_test ()

Function for testing UNIQUE constraint.

# 7.98.1 Detailed Description

Provides functions for unique constraint

# 7.98.2 Function Documentation

# 7.98.2.1 AK\_delete\_constraint\_unique()

Function for deleting specific unique constraint.

**Author** 

Blaž Rajič, updated by Bruno Pilošta

### **Parameters**

tableName	name of table on which constraint refers
constraintName	name of constraint

### Returns

EXIT\_SUCCESS when constraint is deleted, else EXIT\_ERROR

# 7.98.2.2 AK\_read\_constraint\_unique()

Function that checks if the insertion of some value(s) would violate the UNIQUE constraint.

Author

Domagoj Tuličić, updated by Nenad Makar

char*	tableName name of table

## **Parameters**

char	attName[] name(s) of attribute(s), if you want to check combination of values of more attributes seperate names of attributes with constant SEPARATOR (see test)
char	newValue[] new value(s), if you want to check combination of values of more attributes seperate their values with constant SEPARATOR (see test), if some value(s) which you want to check isn't stored as char (string) convert it to char (string) using AK_tuple_to_string(struct list_node *tuple) or with sprintf in a similiar way it's used in that function (if value isn't part of a *tuple), to concatenate more values in newValue[] use strcat(destination, source) and put constant SEPARATOR between them (see test) if newValue[] should contain NULL sign pass it as " " (space)

# Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.98.2.3 AK\_set\_constraint\_unique()

Function that sets unique constraint on attribute(s)

## Author

Domagoj Tuličić, updated by Nenad Makar

## **Parameters**

char*	tableName name of table
char	attName[] name(s) of attribute(s), if you want to set UNIQUE constraint on combination of attributes seperate their names with constant SEPARATOR (see test)
char	constraintName[] name of constraint

# Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.98.2.4 AK\_unique\_test()

```
TestResult AK_unique_test ( )
```

Function for testing UNIQUE constraint.

**Author** 

Domagoj Tuličić, updated by Nenad Makar

Returns

No return value

# 7.99 sql/cs/unique.h File Reference

```

```

## **Macros**

• #define NUM DROP FUNCTIONS 9

## **Typedefs**

typedef int(\* DropFunc) (AK\_drop\_arguments \*)
 Function for DROP table, index, view, sequence, trigger, function, user, group and constraint.

## **Functions**

- int AK\_drop (int type, AK\_drop\_arguments \*arguments)
  - Function for DROP table, index, view, sequence, trigger, function, user, group and constraint.
- int AK\_drop\_table (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific table.

- int AK\_drop\_index (AK\_drop\_arguments \*drop\_arguments)
  - Drop function that deletes specific index.
- int AK\_drop\_view (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific view.

- int AK\_drop\_sequence (AK\_drop\_arguments \*drop\_arguments)
  - Drop function that deletes specific sequence.
- int AK\_drop\_trigger (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific trigger.

• int AK\_drop\_function (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific function.

int AK drop user (AK drop arguments \*drop arguments)

Drop function that deletes specific user.

int AK\_drop\_group (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific group.

int AK\_drop\_constraint (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific group.

void AK drop help function (char \*tblName, char \*sys table)

Help function for the drop command. Delete memory blocks and addresses of table and removes table or index from system table.

int AK\_if\_exist (char \*tblName, char \*sys\_table)

Help function for checking if the element(view, function, sequence, user ...) exist in system catalog table.

• TestResult AK\_drop\_test ()

Function for testing all DROP functions.

## **Variables**

- char \* system\_catalog [NUM\_SYS\_TABLES]
- DropFunc dropFunctions []

# 7.100.1 Detailed Description

**Author** 

Unknown, Jurica Hlevnjak - drop table bugs fixed, reorganized code structure, system catalog tables drop disabled, drop index added, drop view added, drop sequence added, drop trigger added, drop\_function added, drop user added, drop group added, AK drop test updated

Provides DROP functions

### 7.100.2 Macro Definition Documentation

# 7.100.2.1 NUM\_DROP\_FUNCTIONS

#define NUM\_DROP\_FUNCTIONS 9

## 7.100.3 Typedef Documentation

# 7.100.3.1 DropFunc

```
typedef int(* DropFunc) (AK_drop_arguments *)
```

Function for DROP table, index, view, sequence, trigger, function, user, group and constraint.

Author

Unknown, Jurica Hlevnjak, updated by Tomislav Ilisevic, Maja Vračan, Fran Turković

### **Parameters**

type	drop type
drop_arguments	arguments of DROP command

# 7.100.4 Function Documentation

# 7.100.4.1 AK\_drop()

Function for DROP table, index, view, sequence, trigger, function, user, group and constraint.

### **Author**

Unknown, Jurica Hlevnjak, updated by Tomislav Ilisevic, Maja Vračan, Fran Turković

## **Parameters**

type	drop type
drop_arguments	arguments of DROP command

# 7.100.4.2 AK\_drop\_constraint()

```
int AK_drop_constraint (  {\it AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific group.

### **Author**

Fran Turković

drop_arguments	arguments of DROP command

# 7.100.4.3 AK\_drop\_function()

```
int AK_drop_function (  {\it AK\_drop\_arguments} \ * \ drop\_arguments \ )
```

Drop function that deletes specific function.

**Author** 

Fran Turković

### **Parameters**

drop_arguments	arguments of DROP command
----------------	---------------------------

## 7.100.4.4 AK\_drop\_group()

Drop function that deletes specific group.

**Author** 

Fran Turković

### **Parameters**

```
drop_arguments | arguments of DROP command
```

# 7.100.4.5 AK\_drop\_help\_function()

Help function for the drop command. Delete memory blocks and addresses of table and removes table or index from system table.

**Author** 

unknown, Jurica Hlevnjak - fix bugs and reorganize code in this function

## **Parameters**

tblName	name of table or index
sys_table	name of system catalog table

# 7.100.4.6 AK\_drop\_index()

```
int AK_drop_index (  {\rm AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific index.

**Author** 

Fran Turković

## **Parameters**

drop_arguments	arguments of DROP command
----------------	---------------------------

# 7.100.4.7 AK\_drop\_sequence()

```
int AK_drop_sequence (  {\rm AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific sequence.

**Author** 

Fran Turković

### **Parameters**

drop_arguments	arguments of DROP command
----------------	---------------------------

# 7.100.4.8 AK\_drop\_table()

```
int AK_drop_table ( \label{eq:ak_drop_arguments} \ * \ drop\_arguments \ )
```

Drop function that deletes specific table.

Author

Fran Turković

### **Parameters**

```
drop_arguments | arguments of DROP command
```

## 7.100.4.9 AK\_drop\_test()

```
TestResult AK_drop_test ( )
```

Function for testing all DROP functions.

**Author** 

unknown, Jurica Hlevnjak - added all tests except drop table test, updated by Tomislav Ilisevic, Maja Vračan, Fran Turković

# 7.100.4.10 AK\_drop\_trigger()

```
int AK_drop_trigger (  {\tt AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific trigger.

Author

Fran Turković

### **Parameters**

# 7.100.4.11 AK\_drop\_user()

```
int AK_drop_user (  {\tt AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific user.

Author

Fran Turković

### **Parameters**

drop_arguments	arguments of DROP command
----------------	---------------------------

# 7.100.4.12 AK\_drop\_view()

Drop function that deletes specific view.

**Author** 

Fran Turković

## **Parameters**

drop_arguments	arguments of DROP command
----------------	---------------------------

# 7.100.4.13 AK\_if\_exist()

Help function for checking if the element(view, function, sequence, user ...) exist in system catalog table.

# Author

Jurica Hlevnjak, updated by Tomislav Ilisevic

### **Parameters**

tk	bIName	name of table, index view, function, trigger, sequence, user, group or constraint
sys_table name of system catalog table		name of system catalog table

## Returns

if element exist in system catalog returns 1, if not returns 0

### **Classes**

· struct drop\_arguments

# **Typedefs**

· typedef struct drop arguments AK drop arguments

## **Functions**

• int AK\_drop (int type, AK\_drop\_arguments \*drop\_arguments)

Function for DROP table, index, view, sequence, trigger, function, user, group and constraint.

• int AK\_drop\_table (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific table.

int AK\_drop\_index (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific index.

int AK\_drop\_view (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific view.

int AK\_drop\_sequence (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific sequence.

• int AK\_drop\_trigger (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific trigger.

int AK\_drop\_function (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific function.

int AK\_drop\_user (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific user.

int AK\_drop\_group (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific group.

int AK\_drop\_constraint (AK\_drop\_arguments \*drop\_arguments)

Drop function that deletes specific group.

void AK\_drop\_help\_function (char \*tblName, char \*sys\_table)

Help function for the drop command. Delete memory blocks and addresses of table and removes table or index from system table.

int AK if exist (char \*tblName, char \*sys table)

Help function for checking if the element(view, function, sequence, user ...) exist in system catalog table.

TestResult AK\_drop\_test ()

Function for testing all DROP functions.

# 7.101.1 Detailed Description

Header file that provides data structures, functions and defines for unique constraint

# 7.101.2 Typedef Documentation

drop arguments	arguments of DROP command
----------------	---------------------------

# 7.101.3.5 AK\_drop\_help\_function()

Help function for the drop command. Delete memory blocks and addresses of table and removes table or index from system table.

**Author** 

unknown, Jurica Hlevnjak - fix bugs and reorganize code in this function

tblName	name of table or index
sys_table	name of system catalog table

# 7.101.3.6 AK\_drop\_index()

Drop function that deletes specific index.

**Author** 

Fran Turković

#### **Parameters**

# 7.101.3.7 AK\_drop\_sequence()

```
int AK_drop_sequence ( \label{eq:ak_drop_arguments} \ * \ drop\_arguments \ )
```

Drop function that deletes specific sequence.

**Author** 

Fran Turković

#### **Parameters**

```
drop_arguments | arguments of DROP command
```

# 7.101.3.8 AK\_drop\_table()

```
int AK_drop_table ( {\tt AK\_drop\_arguments} \ * \ drop\_arguments \ )
```

Drop function that deletes specific table.

Author

Fran Turković

#### **Parameters**

drop\_arguments | arguments of DROP command

# 7.101.3.9 AK\_drop\_test()

```
TestResult AK_drop_test ( )
```

Function for testing all DROP functions.

#### **Author**

unknown, Jurica Hlevnjak - added all tests except drop table test, updated by Tomislav Ilisevic, Maja Vračan, Fran Turković

# 7.101.3.10 AK\_drop\_trigger()

```
int AK_drop_trigger (  {\rm AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific trigger.

Author

Fran Turković

#### **Parameters**

drop\_arguments | arguments of DROP command

## 7.101.3.11 AK\_drop\_user()

```
int AK_drop_user (  {\it AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific user.

Author

Fran Turković

#### **Parameters**

drop_arguments	arguments of DROP command	
----------------	---------------------------	--

# 7.101.3.12 AK\_drop\_view()

```
int AK_drop_view (  {\tt AK\_drop\_arguments} \ * \ drop\_arguments \ ) \\
```

Drop function that deletes specific view.

**Author** 

Fran Turković

### **Parameters**

drop_arguments	arguments of DROP command
----------------	---------------------------

# 7.101.3.13 AK\_if\_exist()

Help function for checking if the element(view, function, sequence, user ...) exist in system catalog table.

Author

Jurica Hlevnjak, updated by Tomislav Ilisevic

#### **Parameters**

tk	bIName	name of table, index view, function, trigger, sequence, user, group or constraint
S	ys_table	name of system catalog table

### Returns

if element exist in system catalog returns 1, if not returns 0

# 7.102 sql/function.c File Reference

```
#include "function.h"
Include dependency graph for function.c:
```

#### **Functions**

• int AK\_get\_function\_obj\_id (char \*function, struct list\_node \*arguments\_list)

Function that gets obj\_id of a function by name and arguments list (transferred from trigger.c/drop.c).

• int AK\_check\_function\_arguments (int function\_id, struct list\_node \*arguments\_list)

Function that checks whether arguments belongs to a function.

• int AK\_check\_function\_arguments\_type (int function\_id, struct list\_node \*args)

Function that checks whether arguments belongs to a function but only checks argument type (not name). Used for drop function.

• int AK\_function\_add (char \*name, int return\_type, struct list\_node \*arguments\_list)

Function that adds a function to system table.

• int AK function arguments add (int function id, int arg number, int arg type, char \*argname)

Function that adds a function argument to system table.

int AK\_function\_remove\_by\_obj\_id (int obj\_id, int num\_args)

Function that removes a function by its obj\_id.

int AK\_function\_arguments\_remove\_by\_obj\_id (int \*obj\_id)

Function that removes function arguments by function id.

int AK\_function\_remove\_by\_name (char \*name, struct list\_node \*arguments\_list)

Function that removes a function from system table by name and arguments.

• int AK function rename (char \*name, struct list node \*arguments list, char \*new name)

Function that changes the function name.

- int AK\_function\_change\_return\_type (char \*name, struct list\_node \*arguments\_list, int new\_return\_type)

  Function that changes the return type.
- TestResult AK\_function\_test ()

Function for functions testing.

# 7.102.1 Detailed Description

Provides functions for functions

# 7.102.2 Function Documentation

### 7.102.2.1 AK\_check\_function\_arguments()

Function that checks whether arguments belongs to a function.

**Author** 

#### **Parameters**

*function_id	id of the function
*arguments_list	list of arguments

#### Returns

EXIT\_SUCCESS of the function or EXIT\_ERROR

#### 7.102.2.2 AK\_check\_function\_arguments\_type()

Function that checks whether arguments belongs to a function but only checks argument type (not name). Used for drop function.

#### **Author**

Jurica Hlevnjak updated by Aleksandra Polak

### **Parameters**

function← _id	id of the function
args	function arguments

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.102.2.3 AK\_function\_add()

Function that adds a function to system table.

### Author

Boris Kišić, updated by Tomislav Ilisevic

#### **Parameters**

*name	name of the function	
*return_type	data type returned from a function - values from 0 to 13 - defined in constants.h	
*arguments_list	list of function arguments	

#### Returns

function id or EXIT\_ERROR

# 7.102.2.4 AK\_function\_arguments\_add()

```
int AK_function_arguments_add (
    int function_id,
    int arg_number,
    int arg_type,
    char * argname )
```

Function that adds a function argument to system table.

### **Author**

Boris Kišić

#### **Parameters**

*function_id	id of the function to which the argument belongs
*arg_number	number of the argument
*arg_type	data type of the argument
*argname	name of the argument

# Returns

function argument id or EXIT\_ERROR

### 7.102.2.5 AK\_function\_arguments\_remove\_by\_obj\_id()

Function that removes function arguments by function id.

### Author

#### **Parameters**

obj⇔	obj_id of the function
_id	

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

### 7.102.2.6 AK\_function\_change\_return\_type()

Function that changes the return type.

### Author

Boris Kišić

### **Parameters**

*name	name of the function to be modified
*arguments_list	list of function arguments
*new_return_type	new return type

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.102.2.7 AK\_function\_remove\_by\_name()

Function that removes a function from system table by name and arguments.

### Author

#### **Parameters**

*name	name of the function
*arguments_list	list of arguments

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.102.2.8 AK\_function\_remove\_by\_obj\_id()

Function that removes a function by its obj\_id.

Author

Boris Kišić, updated by Fran Turković

#### **Parameters**

obj_id	obj_id of the function
num_args	number of agruments

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.102.2.9 AK\_function\_rename()

Function that changes the function name.

**Author** 

#### **Parameters**

*name of the function to be modi	
*arguments_list	list of arguments to be modified
*new_name	new name of the function

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.102.2.10 AK\_function\_test()

```
TestResult AK_function_test ( )
```

Function for functions testing.

#### **Author**

Boris Kišić, updated by Tomislav Ilisevic

#### Returns

No return value

# 7.102.2.11 AK\_get\_function\_obj\_id()

Function that gets obj\_id of a function by name and arguments list (transferred from trigger.c/drop.c).

#### **Author**

Unknown, updated by Jurica Hlevnjak - check function arguments included for drop purpose, updated by Tomislav Ilisevic

*function	name of the function
*arguments_list	list of arguments

Returns

obj\_id of the function or EXIT\_ERROR

# 7.103 sql/function.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/fileio.h"
#include "../auxi/mempro.h"
#include "../auxi/auxiliary.h"
```

Include dependency graph for function.h: This graph shows which files directly or indirectly include this file:

### **Functions**

int AK\_get\_function\_obj\_id (char \*function, struct list\_node \*arguments\_list)

Function that gets obj\_id of a function by name and arguments list (transferred from trigger.c/drop.c).

• int AK\_check\_function\_arguments (int function\_id, struct list\_node \*arguments\_list)

Function that checks whether arguments belongs to a function.

int AK\_check\_function\_arguments\_type (int function\_id, struct list\_node \*args)

Function that checks whether arguments belongs to a function but only checks argument type (not name). Used for drop function.

• int AK\_function\_add (char \*name, int return\_type, struct list\_node \*arguments\_list)

Function that adds a function to system table.

int AK\_function\_arguments\_add (int function\_id, int arg\_number, int arg\_type, char \*argname)

Function that adds a function argument to system table.

• int AK\_function\_remove\_by\_obj\_id (int obj\_id, int num\_args)

Function that removes a function by its obj\_id.

• int AK\_function\_arguments\_remove\_by\_obj\_id (int \*obj\_id)

Function that removes function arguments by function id.

• int AK\_function\_remove\_by\_name (char \*name, struct list\_node \*arguments\_list)

Function that removes a function from system table by name and arguments.

• int AK\_function\_rename (char \*name, struct list\_node \*arguments\_list, char \*new\_name)

Function that changes the function name.

Function that changes the return type.

- int AK\_function\_change\_return\_type (char \*name, struct list\_node \*arguments\_list, int new\_return\_type)
- TestResult AK\_function\_test ()

Function for functions testing.

# 7.103.1 Detailed Description

Header file that provides functions and defines for functions

Header file that provides functions and defines for view.c

# 7.103.2 Function Documentation

#### 7.103.2.1 AK\_check\_function\_arguments()

Function that checks whether arguments belongs to a function.

Author

Boris Kišić

#### **Parameters**

*function_id	id of the function
*arguments_list	list of arguments

### Returns

EXIT\_SUCCESS of the function or EXIT\_ERROR

### 7.103.2.2 AK\_check\_function\_arguments\_type()

Function that checks whether arguments belongs to a function but only checks argument type (not name). Used for drop function.

Author

Jurica Hlevnjak updated by Aleksandra Polak

#### **Parameters**

	function <i>⊷</i> _id	id of the function
ĺ	args	function arguments

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.103.2.3 AK\_function\_add()

Function that adds a function to system table.

#### Author

Boris Kišić, updated by Tomislav Ilisevic

#### **Parameters**

*name	name of the function
*return_type	data type returned from a function - values from 0 to 13 - defined in constants.h
*arguments_list	list of function arguments

### Returns

function id or EXIT\_ERROR

# 7.103.2.4 AK\_function\_arguments\_add()

```
int AK_function_arguments_add (
    int function_id,
    int arg_number,
    int arg_type,
    char * argname )
```

Function that adds a function argument to system table.

### **Author**

Boris Kišić

#### **Parameters**

*function_id	id of the function to which the argument belongs
*arg_number	number of the argument
*arg_type	data type of the argument
*argname	name of the argument

## Returns

function argument id or EXIT\_ERROR

# 7.103.2.5 AK\_function\_arguments\_remove\_by\_obj\_id()

Function that removes function arguments by function id.

**Author** 

Boris Kišić

### **Parameters**

obj⇔	obj_id of the function
_id	

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.103.2.6 AK\_function\_change\_return\_type()

Function that changes the return type.

Author

Boris Kišić

# **Parameters**

*name	name of the function to be modified
*arguments_list	list of function arguments
*new_return_type	new return type

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.103.2.7 AK\_function\_remove\_by\_name()

Function that removes a function from system table by name and arguments.

Author

Boris Kišić

#### **Parameters**

*name	name of the function
*arguments_list	list of arguments

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.103.2.8 AK\_function\_remove\_by\_obj\_id()

Function that removes a function by its obj\_id.

**Author** 

Boris Kišić, updated by Fran Turković

# **Parameters**

obj_id	obj_id of the function
num_args	number of agruments

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.103.2.9 AK\_function\_rename()

```
struct list_node * arguments_list,
char * new_name )
```

Function that changes the function name.

**Author** 

Boris Kišić

#### **Parameters**

*name	name of the function to be modified
*arguments_list	list of arguments to be modified
*new_name	new name of the function

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.103.2.10 AK\_function\_test()

```
TestResult AK_function_test ( )
```

Function for functions testing.

**Author** 

Boris Kišić, updated by Tomislav Ilisevic

Returns

No return value

# 7.103.2.11 AK\_get\_function\_obj\_id()

Function that gets obj\_id of a function by name and arguments list (transferred from trigger.c/drop.c).

# Author

Unknown, updated by Jurica Hlevnjak - check function arguments included for drop purpose, updated by Tomislav Ilisevic

#### **Parameters**

*function	name of the function
*arguments_list	list of arguments

#### Returns

obj\_id of the function or EXIT\_ERROR

# 7.104 sql/insert.c File Reference

```
#include "insert.h"
Include dependency graph for insert.c:
```

### **Functions**

- AK\_header \* AK\_get\_insert\_header (int \*size, char \*tblName, struct list\_node \*columns)
   Function creates headers based on entered columns in SQL command. If no columns are entered it will use table header.
- int AK\_insert (char \*tblName, struct list\_node \*columns, struct list\_node \*values) Function that implements SQL insert command.
- TestResult AK\_insert\_test ()

# 7.104.1 Function Documentation

# 7.104.1.1 AK\_get\_insert\_header()

```
AK_header* AK_get_insert_header (
    int * size,
    char * tblName,
    struct list_node * columns )
```

Function creates headers based on entered columns in SQL command. If no columns are entered it will use table header.

### Author

Filip Žmuk

size	pointer to integer in which size of header will be saved
tblName	table in which rows will be inserted
columns	list of columns in SQL command

#### Returns

header for values to be inserted or EXIT\_ERROR

# 7.104.1.2 AK\_insert()

Function that implements SQL insert command.

#### **Author**

Filip Žmuk

#### **Parameters**

tableName	table in which rows will be inserted
columns	list of columns
values	values to be inserted

# Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.104.1.3 AK\_insert\_test()

```
TestResult AK_insert_test ( )
```

# 7.105 sql/insert.h File Reference

```

#include "privileges.h"
#include <unistd.h>
Include dependency graph for privileges.c:
```

### **Functions**

• int AK\_user\_add (char \*username, int \*password, int set\_id)

Inserts a new user in the AK\_user table.

• int AK\_user\_get\_id (char \*username)

Function that returns an ID of the given user.

• int AK\_user\_check\_pass (char \*username, int \*password)

Function that checks if there is user with given password.

• int AK\_user\_remove\_by\_name (char \*name)

Function that removes the given user.

• int AK\_user\_rename (char \*old\_name, char \*new\_name, int \*password)

Function that renames a given user.

int AK\_group\_add (char \*name, int set\_id)

Function that adds a new group.

int AK\_group\_get\_id (char \*name)

Function that returns the ID from the given group name.

int AK\_group\_remove\_by\_name (char \*name)

Function that removes the given group.

• int AK group rename (char \*old name, char \*new name)

Function that renames the given group.

• int AK\_grant\_privilege\_user (char \*username, char \*table, char \*right)

Function that grants a specific privilege to the desired user on a given table.

• int AK\_revoke\_privilege\_user (char \*username, char \*table, char \*right)

Function that revokes users privilege on the given table.

int AK\_revoke\_all\_privileges\_user (char \*username)

Function that revokes ALL user's privileges on ALL tables (for DROP user)

• int AK\_grant\_privilege\_group (char \*groupname, char \*table, char \*right)

Function that grants a privilege to a given group on a given table.

int AK\_revoke\_privilege\_group (char \*groupname, char \*table, char \*right)

Function that revokes a groups privilege on the given table.

int AK\_revoke\_all\_privileges\_group (char \*groupname)

Function that revokes ALL privileges from the desired group on ALL tables (needed for DROP group)

int AK add user to group (char \*user, char \*group)

Function that puts the desired user in the given group.

• int AK\_remove\_user\_from\_all\_groups (char \*user)

Function that removes user from all groups. Used for DROP user.

int AK\_remove\_all\_users\_from\_group (char \*group)

Function that removes all users from a group. Used for DROP group.

• int AK\_check\_privilege (char \*username, char \*table, char \*privilege)

Function that checks whether the given user has a right for the given operation on the given table.

int AK\_check\_user\_privilege (char \*user)

Function that checks if the user has any privileges or belongs to any group. Used in drop user for restriction.

int AK\_check\_group\_privilege (char \*group)

Function that checks if the group has any privileges. Used in drop group for restriction.

• TestResult AK\_privileges\_test ()

Function that tests all the previous functions.

## 7.106.1 Detailed Description

Provides functions for privileges

### 7.106.2 Function Documentation

#### 7.106.2.1 AK add user to group()

Function that puts the desired user in the given group.

Author

Kristina Takač, updated by Mario Peroković, added verifying the existence of user in the group, updated by Maja Vračan

#### **Parameters**

*user	username of user which will be put in group
*group	name of group in which user will be put

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR if the user is already in the group

# 7.106.2.2 AK\_check\_group\_privilege()

Function that checks if the group has any privileges. Used in drop group for restriction.

#### **Author**

Jurica Hlevnjak, updated by Lidija Lastavec, updated by Marko Flajšek

#### **Parameters**

```
group name of group
```

# Returns

EXIT\_ERROR or EXIT\_SUCCESS

### 7.106.2.3 AK\_check\_privilege()

Function that checks whether the given user has a right for the given operation on the given table.

# Author

Kristina Takač, updated by Marko Flajšek

*user	username for which we want check privileges
*table	name of table for which we want to check whether user has right on
Generale Head Pos	প্রক্লা vilege for which we want to check whether user has right for

#### Returns

EXIT\_SUCCESS if user has right, EXIT\_ERROR if user has no right

# 7.106.2.4 AK\_check\_user\_privilege()

Function that checks if the user has any privileges or belongs to any group. Used in drop user for restriction.

# Author

Jurica Hlevnjak, updated by Lidija Lastavec

#### **Parameters**

```
user name of user
```

# Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.106.2.5 AK\_grant\_privilege\_group()

Function that grants a privilege to a given group on a given table.

### Author

Kristina Takač.

*groupname	name of group to which we want to grant privilege
*table	name of table on which privilege will be granted to user
*right	type of privilege which will be granted to user on given table

#### Returns

privilege\_id or EXIT\_ERROR if table or user aren't correct

# 7.106.2.6 AK\_grant\_privilege\_user()

Function that grants a specific privilege to the desired user on a given table.

#### **Author**

Kristina Takač, updated by Mario Peroković, inserting user id instead of username in AK\_user\_right, updated by Marko Flajšek

#### **Parameters**

*username	username of user to whom we want to grant privilege
*table	name of table on which privilege will be granted to user
*right	type of privilege which will be granted to user on given table

#### Returns

privilege\_id or EXIT\_ERROR if table or user aren't correct

# 7.106.2.7 AK\_group\_add()

```
int AK_group_add ( \label{eq:char} \mbox{char} \, * \, name, \\ \mbox{int} \, \, set\_id \, )
```

Function that adds a new group.

### Author

Kristina Takač, edited by Ljubo Barać, Borna Romić

*name	name of group to be added
set_id	non default id to be passed

#### Returns

id of group

# 7.106.2.8 AK\_group\_get\_id()

Function that returns the ID from the given group name.

Author

Kristina Takač.

#### **Parameters**

\*name | name of group whose id we are looking for

### Returns

id of group, otherwise EXIT\_ERROR

# 7.106.2.9 AK\_group\_remove\_by\_name()

Function that removes the given group.

**Author** 

Ljubo Barać

# **Parameters**

name	Name of the group to be removed
------	---------------------------------

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.106.2.10 AK\_group\_rename()

Function that renames the given group.

Author

Ljubo Barać, update by Lidija Lastavec

#### **Parameters**

old_name	Name of the group to be renamed
new_name	New name of the group

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.106.2.11 AK\_privileges\_test()

```
TestResult AK_privileges_test ( )
```

Function that tests all the previous functions.

Author

Kristina Takač, updated by Tomislav Ilisevic, updated by Lidija Lastavec, updated by Marko Flajšek

Returns

no return value

### 7.106.2.12 AK\_remove\_all\_users\_from\_group()

Function that removes all users from a group. Used for DROP group.

Author

Jurica Hlevnjak, update by Lidija Lastavec

#### **Parameters**

```
group name of group
```

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

### 7.106.2.13 AK\_remove\_user\_from\_all\_groups()

Function that removes user from all groups. Used for DROP user.

#### **Author**

Jurica Hlevnjak, update by Lidija Lastavec

#### **Parameters**

```
user name of user
```

# Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.106.2.14 AK\_revoke\_all\_privileges\_group()

Function that revokes ALL privileges from the desired group on ALL tables (needed for DROP group)

# Author

Jurica Hlevnjak

groupname	name of group from which we want to revoke all privileges
-----------	---

#### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

### 7.106.2.15 AK\_revoke\_all\_privileges\_user()

Function that revokes ALL user's privileges on ALL tables (for DROP user)

### **Author**

Jurica Hlevnjak, updated by Marko Flajšek

#### **Parameters**

username	name of user from whom we want to revoke all privileges
----------	---

#### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

### 7.106.2.16 AK\_revoke\_privilege\_group()

Function that revokes a groups privilege on the given table.

NOTICE: Test 9 isn't currently revoking a privilege since the obj\_id in the AK\_group\_right table is passing the value of 127. Once the issue #87 on GitHub concerning the data type is solved, the test should be working as expected.

# Author

Kristina Takač, updated by Mario Peroković - added comparing by table id

*grounamep	name of group which user belongs to
*table	name of table on which privilege will be granted to group
*right	type of privilege which will be granted to group on a given table

#### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

# 7.106.2.17 AK\_revoke\_privilege\_user()

Function that revokes users privilege on the given table.

NOTICE: Test 12 isn't currently revoking a privilege since the obj\_id in the AK\_group\_right table is passing the value of 127. Once the issue #87 on GitHub concerning the data type is solved, the test should be working as expected.

#### **Author**

Kristina Takač, updated by Mario Peroković - added comparing by table id, and use of user\_id in AK\_user\_right

#### **Parameters**

*username	username of user to whom we want to grant privilege
*table	name of table on which privilege will be revoked from user
*right	type of privilege which will be revoked from user on given table

### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

# 7.106.2.18 AK\_user\_add()

Inserts a new user in the AK\_user table.

# Author

Kristina Takač, edited by Borna Romić

*username	username of user to be added
*password	password of user to be added
set_id	obj_id of the new user

#### Returns

user\_id

# 7.106.2.19 AK\_user\_check\_pass()

Function that checks if there is user with given password.

### Author

Fran Mlkolić.

#### **Parameters**

*username	username of user whose password we are checking
*password	password of given username whom we will check

#### Returns

check 0 if false or 1 if true

# 7.106.2.20 AK\_user\_get\_id()

Function that returns an ID of the given user.

### **Author**

Kristina Takač, updated by Barbara Tatai (fix leaks)

# **Parameters**

*username	username of user whose id we are looking for
-----------	--

# Returns

user\_id, otherwise EXIT\_ERROR

# 7.106.2.21 AK\_user\_remove\_by\_name()

Function that removes the given user.

**Author** 

Ljubo Barać

#### **Parameters**

name	Name of the user to be removed
------	--------------------------------

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.106.2.22 AK\_user\_rename()

Function that renames a given user.

**Author** 

Ljubo Barać, update by Lidija Lastavec, update by Marko Flajšek

# Parameters

old_name	Name of the user to be renamed
new_name	New name of the user
password	Password of the user to be renamed (should be provided)

### Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.107 sql/privileges.h File Reference

#include "../auxi/mempro.h"
```

Include dependency graph for privileges.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

int AK user add (char \*username, int \*password, int set id)

Inserts a new user in the AK\_user table.

int AK\_user\_get\_id (char \*username)

Function that returns an ID of the given user.

int AK\_user\_check\_pass (char \*username, int \*password)

Function that checks if there is user with given password.

int AK\_group\_add (char \*name, int set\_id)

Function that adds a new group.

int AK\_group\_get\_id (char \*name)

Function that returns the ID from the given group name.

int AK\_grant\_privilege\_user (char \*username, char \*table, char \*right)

Function that grants a specific privilege to the desired user on a given table.

int AK\_revoke\_privilege\_user (char \*username, char \*table, char \*right)

Function that revokes users privilege on the given table.

int AK\_revoke\_all\_privileges\_user (char \*username)

Function that revokes ALL user's privileges on ALL tables (for DROP user)

• int AK\_grant\_privilege\_group (char \*groupname, char \*table, char \*right)

Function that grants a privilege to a given group on a given table.

• int AK revoke privilege group (char \*groupname, char \*table, char \*right)

Function that revokes a groups privilege on the given table.

int AK\_revoke\_all\_privileges\_group (char \*groupname)

Function that revokes ALL privileges from the desired group on ALL tables (needed for DROP group)

• int AK add user to group (char \*user, char \*group)

Function that puts the desired user in the given group.

int AK\_remove\_user\_from\_all\_groups (char \*user)

Function that removes user from all groups. Used for DROP user.

int AK\_remove\_all\_users\_from\_group (char \*group)

Function that removes all users from a group. Used for DROP group.

int AK\_check\_privilege (char \*username, char \*table, char \*privilege)

Function that checks whether the given user has a right for the given operation on the given table.

• int AK\_check\_user\_privilege (char \*user)

Function that checks if the user has any privileges or belongs to any group. Used in drop user for restriction.

int AK\_check\_group\_privilege (char \*group)

Function that checks if the group has any privileges. Used in drop group for restriction.

• int AK\_group\_remove\_by\_name (char \*name)

Function that removes the given group.

int AK\_user\_rename (char \*old\_name, char \*new\_name, int \*password)

Function that renames a given user.

• int AK\_group\_rename (char \*old\_name, char \*new\_name)

Function that renames the given group.

TestResult AK\_privileges\_test ()

Function that tests all the previous functions.

# 7.107.1 Detailed Description

Header file that provides functions and defines for privileges.c

# 7.107.2 Function Documentation

### 7.107.2.1 AK\_add\_user\_to\_group()

Function that puts the desired user in the given group.

#### **Author**

Kristina Takač, updated by Mario Peroković, added verifying the existence of user in the group, updated by Maja Vračan

### **Parameters**

*user	username of user which will be put in group
*group	name of group in which user will be put

### Returns

EXIT\_SUCCESS or EXIT\_ERROR if the user is already in the group

### 7.107.2.2 AK\_check\_group\_privilege()

```
int AK_check_group_privilege ( {\tt char} \ * \ group \ )
```

Function that checks if the group has any privileges. Used in drop group for restriction.

### **Author**

Jurica Hlevnjak, updated by Lidija Lastavec, updated by Marko Flajšek

group	name of group
-------	---------------

#### Returns

EXIT\_ERROR or EXIT\_SUCCESS

# 7.107.2.3 AK\_check\_privilege()

Function that checks whether the given user has a right for the given operation on the given table.

#### **Author**

Kristina Takač, updated by Marko Flajšek

#### **Parameters**

*user	username for which we want check privileges
*table	name of table for which we want to check whether user has right on
*privilege	privilege for which we want to check whether user has right for

## Returns

EXIT\_SUCCESS if user has right, EXIT\_ERROR if user has no right

### 7.107.2.4 AK\_check\_user\_privilege()

Function that checks if the user has any privileges or belongs to any group. Used in drop user for restriction.

# Author

Jurica Hlevnjak, updated by Lidija Lastavec

#### Returns

```
EXIT_ERROR or EXIT_SUCCESS
```

# 7.107.2.5 AK\_grant\_privilege\_group()

Function that grants a privilege to a given group on a given table.

#### **Author**

Kristina Takač.

#### **Parameters**

*groupname	name of group to which we want to grant privilege
*table	name of table on which privilege will be granted to user
*right	type of privilege which will be granted to user on given table

#### Returns

privilege\_id or EXIT\_ERROR if table or user aren't correct

# 7.107.2.6 AK\_grant\_privilege\_user()

Function that grants a specific privilege to the desired user on a given table.

### Author

Kristina Takač, updated by Mario Peroković, inserting user id instead of username in AK\_user\_right, updated by Marko Flajšek

*username	username of user to whom we want to grant privilege
*table	name of table on which privilege will be granted to user
*right	type of privilege which will be granted to user on given table

### Returns

privilege\_id or EXIT\_ERROR if table or user aren't correct

# 7.107.2.7 AK\_group\_add()

```
int AK_group_add ( \label{eq:char} \mbox{char} \ * \ name, \\ \mbox{int} \ set\_id \ )
```

Function that adds a new group.

### Author

Kristina Takač, edited by Ljubo Barać

#### **Parameters**

*name	name of group to be added
set_id	non default id to be passed

### Returns

id of group

# Author

Kristina Takač, edited by Ljubo Barać, Borna Romić

### **Parameters**

*name	name of group to be added
set_id	non default id to be passed

# Returns

id of group

### 7.107.2.8 AK\_group\_get\_id()

Function that returns the ID from the given group name.

### Author

Kristina Takač.

#### **Parameters**

*name	name of group whose id we are looking for
-------	---

#### Returns

id of group, otherwise EXIT\_ERROR

# 7.107.2.9 AK\_group\_remove\_by\_name()

Function that removes the given group.

Author

Ljubo Barać

#### **Parameters**

name	Name of the group to be removed
------	---------------------------------

# Returns

EXIT\_SUCCESS or EXIT\_ERROR

# 7.107.2.10 AK\_group\_rename()

Function that renames the given group.

Author

Ljubo Barać, update by Lidija Lastavec

#### **Parameters**

old_name	Name of the group to be renamed
new_name	New name of the group

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.107.2.11 AK\_privileges\_test()

```
TestResult AK_privileges_test ( )
```

Function that tests all the previous functions.

## Author

Kristina Takač, updated by Tomislav Ilisevic, updated by Lidija Lastavec, updated by Marko Flajšek

#### Returns

no return value

## 7.107.2.12 AK\_remove\_all\_users\_from\_group()

```
int AK_remove_all_users_from_group ( {\tt char} \ * \ group \ )
```

Function that removes all users from a group. Used for DROP group.

## Author

Jurica Hlevnjak, update by Lidija Lastavec

## **Parameters**

group	name of group

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

#### 7.107.2.13 AK\_remove\_user\_from\_all\_groups()

```
int AK_remove_user_from_all_groups ( {\tt char} \, * \, user \, )
```

Function that removes user from all groups. Used for DROP user.

**Author** 

Jurica Hlevnjak, update by Lidija Lastavec

#### **Parameters**

```
user name of user
```

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.107.2.14 AK\_revoke\_all\_privileges\_group()

Function that revokes ALL privileges from the desired group on ALL tables (needed for DROP group)

**Author** 

Jurica Hlevnjak

#### **Parameters**

groupname name of group from which we	want to revoke all privileges
---------------------------------------	-------------------------------

#### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

## 7.107.2.15 AK\_revoke\_all\_privileges\_user()

Function that revokes ALL user's privileges on ALL tables (for DROP user)

#### Author

Jurica Hlevnjak, updated by Marko Flajšek

#### **Parameters**

#### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

## 7.107.2.16 AK\_revoke\_privilege\_group()

Function that revokes a groups privilege on the given table.

## **Author**

Kristina Takač, updated by Mario Peroković - added comparing by table id

### **Parameters**

*grounamep	name of group which user belongs to
*table	name of table on which privilege will be granted to group
*right	type of privilege which will be granted to group on a given table

### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

NOTICE: Test 9 isn't currently revoking a privilege since the obj\_id in the AK\_group\_right table is passing the value of 127. Once the issue #87 on GitHub concerning the data type is solved, the test should be working as expected.

#### Author

Kristina Takač, updated by Mario Peroković - added comparing by table id

*grounamep	name of group which user belongs to
*table	name of table on which privilege will be granted to group
*right	type of privilege which will be granted to group on a given table

#### Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

## 7.107.2.17 AK\_revoke\_privilege\_user()

Function that revokes users privilege on the given table.

#### **Author**

Kristina Takač, updated by Mario Peroković - added comparing by table id, and use of user\_id in AK\_user\_right

## **Parameters**

*username	username of user to whom we want to grant privilege
*table	name of table on which privilege will be revoked from user
*right	type of privilege which will be revoked from user on given table

## Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

NOTICE: Test 12 isn't currently revoking a privilege since the obj\_id in the AK\_group\_right table is passing the value of 127. Once the issue #87 on GitHub concerning the data type is solved, the test should be working as expected.

## **Author**

Kristina Takač, updated by Mario Peroković - added comparing by table id, and use of user\_id in AK\_user\_right

### **Parameters**

*username	username of user to whom we want to grant privilege
*table	name of table on which privilege will be revoked from user
*right	type of privilege which will be revoked from user on given table

## Returns

EXIT\_SUCCESS if privilege is revoked, EXIT\_ERROR if it isn't

## 7.107.2.18 AK\_user\_add()

Inserts a new user in the AK\_user table.

**Author** 

Kristina Takač.

#### **Parameters**

*username	username of user to be added
*password	password of user to be added
set_id	obj_id of the new user

#### Returns

user\_id

## **Author**

Kristina Takač, edited by Borna Romić

## **Parameters**

*username	username of user to be added
*password	password of user to be added
set_id	obj_id of the new user

## Returns

user\_id

## 7.107.2.19 AK\_user\_check\_pass()

Function that checks if there is user with given password.

## **Author**

Fran Mlkolić.

## **Parameters**

*username	username of user whose password we are checking
*password	password of given username whom we will check

## Returns

check 0 if false or 1 if true

## 7.107.2.20 AK\_user\_get\_id()

Function that returns an ID of the given user.

## Author

Kristina Takač.

#### **Parameters**

## Returns

user\_id, otherwise EXIT\_ERROR

## Author

Kristina Takač, updated by Barbara Tatai (fix leaks)

## **Parameters**

*username   username of user whose id we are looking	for
--	-----

## Returns

user\_id, otherwise EXIT\_ERROR

## 7.107.2.21 AK\_user\_rename()

```
char * new_name,
int * password )
```

Function that renames a given user.

**Author** 

Ljubo Barać, update by Lidija Lastavec, update by Marko Flajšek

#### **Parameters**

old_name	Name of the user to be renamed
new_name	New name of the user
password	Password of the user to be renamed (should be provided)

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.108 sql/select.c File Reference

```
#include "select.h"
#include "../mm/memoman.h"
Include dependency graph for select.c:
```

#### **Functions**

- int AK\_apply\_select\_by\_condition (char \*src\_table, char \*selection\_table, struct list\_node \*condition)

  Helper function in SELECT clause which filters by condition.
- int AK\_apply\_select\_by\_sorting (char \*sorted\_table, char \*selection\_table, struct list\_node \*ordering)

  Helper function in SELECT clause which does the ordering.
- void AK\_apply\_select\_free\_temp\_tables (char \*src\_table, char \*selection\_table, char \*sorted\_table) Function that clears temporary tables.
- void AK\_create\_copy\_of\_attributes (struct list\_node \*attributes, struct list\_node \*projection\_attributes)

  Helper function that create copy of attributes.
- void AK\_clear\_projection\_attributes (struct list\_node \*projection\_attributes)

Helper function that clears projection of attributes.

• int AK\_apply\_select (char \*srcTable, char \*selection\_table, struct list\_node \*condition, struct list\_node \*attributes, struct list\_node \*projection\_attributes, char \*sorted\_table, struct list\_node \*ordering)

Helper function that apply select by condition or by sorting.

• int AK\_select (char \*src\_table, char \*dest\_table, struct list\_node \*attributes, struct list\_node \*condition, struct list\_node \*ordering)

Function that implements SELECT relational operator.

• TestResult AK select test ()

Function for testing the implementation.

## 7.108.1 Detailed Description

Provides functions for SELECT relational operator

## 7.108.2 Function Documentation

## 7.108.2.1 AK\_apply\_select()

Helper function that apply select by condition or by sorting.

#### **Author**

Emma Uđbinac

#### **Parameters**

srcTable	- original table that is used for selection
selection_table	- temp table tfor selection
condition	- condition for selection
attributes	- atributes to be selected
projection_attributes	- projected attributes
sorted_table	- temp table for sorting
ordering	- atributes for result sorting

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.108.2.2 AK\_apply\_select\_by\_condition()

Helper function in SELECT clause which filters by condition.

#### **Author**

Filip Žmuk, Edited by: Marko Belusic

#### **Parameters**

src_table	- original table that is used for selection	
selection_table	- table in which result of applied condition is stored	
condition	- condition for selection	

## Returns

EXIT\_SUCCESS if there was no error applying condition

## 7.108.2.3 AK\_apply\_select\_by\_sorting()

Helper function in SELECT clause which does the ordering.

#### Author

Filip Žmuk, Edited by: Marko Belusic

## Parameters

ordering	- condition on which to order
sorted_table	- table in which result of applied ordering is stored
selection_table	- table in which result of applied condition is stored

#### Returns

EXIT\_SUCCESS if there was no error ordering

## 7.108.2.4 AK\_apply\_select\_free\_temp\_tables()

Function that clears temporary tables.

**Author** 

Filip Žmuk, Edited by: Marko Belusic

#### **Parameters**

sorted_table	- table in which result of applied ordering is stored
selection_table	- table in which result of applied condition is stored
src_table	- original table that is used for selection

## 7.108.2.5 AK\_clear\_projection\_attributes()

Helper function that clears projection of attributes.

Author

Emma Uđbinac

## Parameters

## 7.108.2.6 AK\_create\_copy\_of\_attributes()

Helper function that create copy of attributes.

Author

Emma Uđbinac

#### **Parameters**

attributes	- atributes to be selected
projection_attributes	- projected atributes

## 7.108.2.7 AK\_select()

Function that implements SELECT relational operator.

## Author

Filip Žmuk, Edited by: Marko Belusic

#### **Parameters**

src_table	- original table that is used for selection
dest_table	- table that contains the result
condition	- condition for selection
attributes	- atributes to be selected
ordering	- atributes for result sorting

## Returns

EXIT\_SUCCESS if cache result in memory and print table else break

## 7.108.2.8 AK\_select\_test()

```
TestResult AK_select_test ( )
```

Function for testing the implementation.

## Author

Renata Mesaros, updated by Filip Žmuk and Josip Susnjara

## 7.109 sql/select.h File Reference

```
#include "../file/table.h"
#include "../auxi/test.h"
#include "../file/fileio.h"
#include "../rel/selection.h"
#include "../rel/projection.h"
#include "../auxi/auxiliary.h"
#include "../auxi/mempro.h"
#include "../file/filesort.h"
```

Include dependency graph for select.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

• int AK\_select (char \*srcTable, char \*destTable, struct list\_node \*attributes, struct list\_node \*condition, struct list\_node \*ordering)

Function that implements SELECT relational operator.

• TestResult AK\_select\_test ()

Function for testing the implementation.

## 7.109.1 Detailed Description

Header file that provides functions for select.h

### 7.109.2 Function Documentation

## 7.109.2.1 AK\_select()

Function that implements SELECT relational operator.

**Author** 

Filip Žmuk

srcTable	- original table that is used for selection
destTable	- table that contains the result
condition	- condition for selection
attributes	- atributes to be selected
ordering	- atributes for result sorting

#### Returns

EXIT\_SUCCESS if cache result in memory and print table else break

#### **Author**

Filip Žmuk, Edited by: Marko Belusic

#### **Parameters**

src_table	- original table that is used for selection
dest_table	- table that contains the result
condition	- condition for selection
attributes	- atributes to be selected
ordering	- atributes for result sorting

#### Returns

EXIT\_SUCCESS if cache result in memory and print table else break

## 7.109.2.2 AK\_select\_test()

```
TestResult AK_select_test ( )
```

Function for testing the implementation.

Author

Renata Mesaros, updated by Filip Žmuk and Josip Susnjara

# 7.110 sql/trigger.c File Reference

```
#include "trigger.h"
Include dependency graph for trigger.c:
```

#### **Functions**

int AK\_trigger\_save\_conditions (int trigger, struct list\_node \*condition)

Function that saves conditions for a trigger.

• int AK\_trigger\_add (char \*name, char \*event, struct list\_node \*condition, char \*table, char \*function, struct list\_node \*arguments\_list)

Function that adds a trigger to the system table.

int AK\_trigger\_get\_id (char \*name, char \*table)

Function that gets obj\_id of a trigger defined by name and table.

int AK\_trigger\_remove\_by\_name (char \*name, char \*table)

Function that removes a trigger from the system table by name.

• int AK\_trigger\_remove\_by\_obj\_id (int obj\_id)

Function that removes a trigger by its obj\_id.

• int AK\_trigger\_edit (char \*name, char \*event, struct list\_node \*condition, char \*table, char \*function, struct list\_node \*arguments\_list)

Function that edits information about the trigger in system table. In order to identify the trigger, either obj\_id or table and name parameters should be defined. The other options should be set to NULL. Values of parameters that aren't changing can be left NULL. If conditions are to be removed, condition parameter should hold an empty list.

struct list\_node \* AK\_trigger\_get\_conditions (int trigger)

Function that fetches postfix list of conditions for the trigger (compatible with selection)

• int AK\_trigger\_rename (char \*old\_name, char \*new\_name, char \*table)

Function that renames the trigger.

• TestResult AK\_trigger\_test ()

Function for trigger testing.

## 7.110.1 Detailed Description

Provides functions for triggers

#### 7.110.2 Function Documentation

## 7.110.2.1 AK\_trigger\_add()

Function that adds a trigger to the system table.

#### **Author**

Unknown updated by Aleksandra Polak, fixed by Josip Susnjara

*name	name of the trigger	
*event	event that calls the trigger - this should perhaps be an integer with defined constants	
*condition	AK_list list of conditions in postfix	
*table	*table name of the table trigger is hooked on	
*function	function that is being called by the trigger	

#### Returns

trigger id or EXIT\_ERROR

## 7.110.2.2 AK\_trigger\_edit()

Function that edits information about the trigger in system table. In order to identify the trigger, either obj\_id or table and name parameters should be defined. The other options should be set to NULL. Values of parameters that aren't changing can be left NULL. If conditions are to be removed, condition parameter should hold an empty list.

Function that edits information about the trigger in system table.

#### **Author**

Unknown, fixed by Josip Susnjara

## **Parameters**

*name	name of the trigger (or NULL if using obj_id)
*event	event of the trigger (or NULL if it isn't changing)
*condition	list of conditions for trigger (or NULL if it isn't changing; empty list if all conditions are to be removed)
*table	name of the connected table (or NULL id using obj_id)
*function	name of the connected function (or NULL if it isn't changing)
*arguments_list	arguments of the function (without arguments can't find passed function)

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.110.2.3 AK\_trigger\_get\_conditions()

```
struct list_node* AK_trigger_get_conditions (
```

Function that fetches postfix list of conditions for the trigger (compatible with selection)

## Author

Unknown, updated by Mario Peroković

#### **Parameters**

trigger obj	_id of the trigger
-------------	--------------------

## Returns

list of conditions for the trigger

## 7.110.2.4 AK\_trigger\_get\_id()

Function that gets obj\_id of a trigger defined by name and table.

#### **Author**

Unknown, fixed by Josip Susnjara

## **Parameters**

*name	name of the trigger
*table	name of the table on which the trigger is hooked

#### Returns

obj\_id of the trigger or EXIT\_ERROR

## 7.110.2.5 AK\_trigger\_remove\_by\_name()

Function that removes a trigger from the system table by name.

## Author

Unknown

*name	name of the trigger
*table	name of the table

Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.110.2.6 AK\_trigger\_remove\_by\_obj\_id()

```
int AK_trigger_remove_by_obj_id ( int \ obj\_id \ )
```

Function that removes a trigger by its obj\_id.

Author

Unknown

#### **Parameters**

obj⊷	obj_id of the trigger
_id	

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.110.2.7 AK\_trigger\_rename()

Function that renames the trigger.

Author

Ljubo Barać

old_name	Name of the trigger to be renamed
new_name	New name of the trigger

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.110.2.8 AK\_trigger\_save\_conditions()

```
int AK_trigger_save_conditions ( int \ trigger, \\ struct \ list_node * condition )
```

Function that saves conditions for a trigger.

#### **Author**

Unknown, updated by Mario Peroković, fixed by Josip Susnjara

#### **Parameters**

trigger	obj_id of the trigger in question
*condition	AK_list list of conditions

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.110.2.9 AK\_trigger\_test()

```
TestResult AK_trigger_test ( )
```

Function for trigger testing.

Author

Unknown updated by Aleksandra Polak and Josip Susnjara

## 7.111 sql/trigger.h File Reference

```
#include "../auxi/test.h"
#include "../rec/archive_log.h"
#include "../file/table.h"
#include "../file/fileio.h"
#include "../file/id.h"
#include "../sql/function.h"
#include "../rel/selection.h"
#include "../auxi/mempro.h"
```

Include dependency graph for trigger.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

• int AK\_trigger\_save\_conditions (int trigger, struct list\_node \*condition)

Function that saves conditions for a trigger.

• int AK\_trigger\_add (char \*name, char \*event, struct list\_node \*condition, char \*table, char \*function, struct list\_node \*arguments\_list)

Function that adds a trigger to the system table.

int AK\_trigger\_get\_id (char \*name, char \*table)

Function that gets obj\_id of a trigger defined by name and table.

int AK\_trigger\_remove\_by\_name (char \*name, char \*table)

Function that removes a trigger from the system table by name.

int AK\_trigger\_remove\_by\_obj\_id (int obj\_id)

Function that removes a trigger by its obj\_id.

• int AK\_trigger\_edit (char \*name, char \*event, struct list\_node \*condition, char \*table, char \*function, struct list\_node \*arguments\_list)

Function that edits information about the trigger in system table.

struct list\_node \* AK\_trigger\_get\_conditions (int trigger)

Function that fetches postfix list of conditions for the trigger (compatible with selection)

• int AK\_trigger\_rename (char \*old\_name, char \*new\_name, char \*table)

Function that renames the trigger.

TestResult AK\_trigger\_test ()

Function for trigger testing.

## 7.111.1 Detailed Description

Header file that provides functions and defines for trigger.c

## 7.111.2 Function Documentation

#### 7.111.2.1 AK\_trigger\_add()

Function that adds a trigger to the system table.

**Author** 

Unknown updated by Aleksandra Polak

## **Parameters**

*name	name of the trigger
*event	event that calls the trigger - this should perhaps be an integer with defined constants
*condition	AK_list list of conditions in postfix
*table	name of the table trigger is hooked on
*function	function that is being called by the trigger

## Returns

trigger id or EXIT\_ERROR

#### **Author**

Unknown updated by Aleksandra Polak, fixed by Josip Susnjara

#### **Parameters**

*name	name of the trigger
*event	event that calls the trigger - this should perhaps be an integer with defined constants
*condition	AK_list list of conditions in postfix
*table	name of the table trigger is hooked on
*function	function that is being called by the trigger

## Returns

trigger id or EXIT\_ERROR

## 7.111.2.2 AK\_trigger\_edit()

Function that edits information about the trigger in system table.

#### **Author**

Unknown, fixed by Josip Susnjara

*name   name of the trigger (or NULL if using obj_id)
---

#### **Parameters**

*event	event of the trigger (or NULL if it isn't changing)
*condition	list of conditions for trigger (or NULL if it isn't changing; empty list if all conditions are to be removed)
*table	name of the connected table (or NULL id using obj_id)
*function	name of the connected function (or NULL if it isn't changing)
*arguments_list	arguments of the function (without arguments can't find passed function)

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

Function that edits information about the trigger in system table.

## **Author**

Unknown, fixed by Josip Susnjara

## **Parameters**

*name	name of the trigger (or NULL if using obj_id)
*event	event of the trigger (or NULL if it isn't changing)
*condition	list of conditions for trigger (or NULL if it isn't changing; empty list if all conditions are to be removed)
*table	name of the connected table (or NULL id using obj_id)
*function	name of the connected function (or NULL if it isn't changing)
*arguments_list	arguments of the function (without arguments can't find passed function)

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.111.2.3 AK\_trigger\_get\_conditions()

Function that fetches postfix list of conditions for the trigger (compatible with selection)

## **Author**

Unknown, updated by Mario Peroković

## **Parameters**

trigger	obj_id of the trigger	
---------	-----------------------	--

## Returns

list of conditions for the trigger

## 7.111.2.4 AK\_trigger\_get\_id()

Function that gets obj\_id of a trigger defined by name and table.

**Author** 

## **Parameters**

*name	name of the trigger
*table	name of the table on which the trigger is hooked

## Returns

obj\_id of the trigger or EXIT\_ERROR

## Author

Unknown, fixed by Josip Susnjara

### **Parameters**

*name	name of the trigger
*table	name of the table on which the trigger is hooked

## Returns

obj\_id of the trigger or EXIT\_ERROR

## 7.111.2.5 AK\_trigger\_remove\_by\_name()

Function that removes a trigger from the system table by name.

**Author** 

Unknown

#### **Parameters**

*name	name of the trigger
*table	name of the table

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.111.2.6 AK\_trigger\_remove\_by\_obj\_id()

```
int AK_trigger_remove_by_obj_id ( \label{eq:condition} \text{int } obj\_id \ )
```

Function that removes a trigger by its obj\_id.

Author

Unknown

## **Parameters**

obj⇔	obj_id of the trigger
_id	

## Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.111.2.7 AK\_trigger\_rename()

```
char * new_name,
char * table )
```

Function that renames the trigger.

**Author** 

Ljubo Barać

#### **Parameters**

old_name	Name of the trigger to be renamed
new_name	New name of the trigger

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

## 7.111.2.8 AK\_trigger\_save\_conditions()

```
int AK_trigger_save_conditions ( int \ trigger, struct \ list_node * condition )
```

Function that saves conditions for a trigger.

Author

Unknown, updated by Mario Peroković, check if data is TYPE\_INT

#### **Parameters**

trigger	obj_id of the trigger in question
*condition	AK_list list of conditions

#### Returns

EXIT\_SUCCESS or EXIT\_ERROR

Author

Unknown, updated by Mario Peroković, fixed by Josip Susnjara

trigger	obj_id of the trigger in question
*condition	AK_list list of conditions

Returns

EXIT\_SUCCESS or EXIT\_ERROR

#### 7.111.2.9 AK\_trigger\_test()

```
TestResult AK_trigger_test ( )
```

Function for trigger testing.

**Author** 

Unknown updated by Aleksandra Polak and Josip Susnjara

# 7.112 sql/view.c File Reference

```
#include "view.h"
```

Include dependency graph for view.c:

#### **Functions**

char \* AK\_check\_view\_name (char \*name)

Function that checks if the name of the view already exists in AK\_view table.

int AK\_get\_view\_object\_id (char \*name)

Function that finds an object's id by its name.

char \* AK\_get\_view\_query (char \*name)

Function that returns a query by its name.

char \* AK\_get\_relation\_expression (char \*name)

Function that returns a relation expression by its name param name name of the view.

int AK\_view\_add (char \*name, char \*query, char \*rel\_exp, int set\_id)

Function that adds a new view to the view table with the corresponding name and value (view query); set\_id is optional, if it's not set, the system will determine the new id automatically.

int AK\_view\_remove\_by\_object\_id (int obj\_id)

Function that removes the view by its object id.

int AK\_view\_rename (char \*name, char \*new\_name)

Function that renames a view (based on it's name) from "name" to "new\_name".

int AK\_view\_remove\_by\_name (char \*name)

Function that removes the view by its name by identifying the view's id and passing id to AK\_view\_remove\_by\_\cup object\_id.

• int AK\_view\_change\_query (char \*name, char \*query, char \*rel\_exp)

Function that changes the query from a view (determined by it's name) to "query".

int AK\_test\_get\_view\_data (char \*rel\_exp)

Function that shows the data from test view query. Only for test purpose.

TestResult AK\_view\_test ()

A testing function for view.c functions.

## 7.112.1 Detailed Description

Provides functions for views

## 7.112.2 Function Documentation

## 7.112.2.1 AK\_check\_view\_name()

Function that checks if the name of the view already exists in AK\_view table.

Author

Sara Kisic

**Parameters** 

name Name of the view

Returns

EXIT\_ERROR if the name already exists or name

## 7.112.2.2 AK\_get\_relation\_expression()

Function that returns a relation expression by its name param name name of the view.

**Author** 

Danko Sačer

Returns

rel\_exp string or EXIT\_ERROR

## 7.112.2.3 AK\_get\_view\_object\_id()

Function that finds an object's id by its name.

**Author** 

Kresimir Ivkovic

#### **Parameters**

#### Returns

View's id or EXIT\_ERROR

## 7.112.2.4 AK\_get\_view\_query()

Function that returns a query by its name.

**Author** 

Danko Sačer

## **Parameters**

```
name name of the view
```

## Returns

query string or EXIT\_ERROR

## 7.112.2.5 AK\_test\_get\_view\_data()

Function that shows the data from test view query. Only for test purpose.

**Author** 

Darko Hranic

#### **Parameters**

rel_exp   conditions as string
--------------------------------

## 7.112.2.6 AK\_view\_add()

Function that adds a new view to the view table with the corresponding name and value (view query); set\_id is optional, if it's not set, the system will determine the new id automatically.

#### **Author**

Kresimir Ivkovic

#### **Parameters**

name	name og the view
query	query of the view
rel_exp	relation expression of the view
set_id	id of view

#### Returns

Id of the newly inserted view

## 7.112.2.7 AK\_view\_change\_query()

Function that changes the query from a view (determined by it's name) to "query".

## Author

Kresimir Ivkovic

#### **Parameters**

name	of the query
query	new query of the view
rel_exp	relation expression of the view

#### Returns

error or success

## 7.112.2.8 AK\_view\_remove\_by\_name()

Function that removes the view by its name by identifying the view's id and passing id to AK\_view\_remove\_by\_
object\_id.

Function that removes the view by its name by identifying the view's id and passing id to AK\_view\_remove\_by\_
obj\_id.

## **Author**

Kresimir Ivkovic

#### **Parameters**

## Returns

Result of AK\_view\_remove\_by\_object\_id or EXIT\_ERROR if no id is found

## 7.112.2.9 AK\_view\_remove\_by\_object\_id()

Function that removes the view by its object id.

## Author

Kresimir Ivkovic

#### **Parameters**

obj⇔	object id of the view
_id	

#### Returns

Result of AK\_delete\_row for the view (success or error)

## 7.112.2.10 AK\_view\_rename()

Function that renames a view (based on it's name) from "name" to "new\_name".

#### **Author**

Kresimir Ivkovic

## **Parameters**

name	name of the view
new_name	new name of the view

#### Returns

error or success

## 7.112.2.11 AK\_view\_test()

```
TestResult AK_view_test ( )
```

A testing function for view.c functions.

**Author** 

Kresimir Ivkovic, updated by Lidija Lastavec

# 7.113 sql/view.h File Reference

```
#include "../auxi/test.h"
#include "../file/table.h"
#include "../file/id.h"
#include "../file/fileio.h"
#include "../auxi/mempro.h"
```

Include dependency graph for view.h: This graph shows which files directly or indirectly include this file:

#### **Functions**

char \* AK\_check\_view\_name (char \*name)

Function that checks if the name of the view already exists in AK\_view table.

• int AK\_view\_add (char \*name, char \*query, char \*rel\_exp, int set\_id)

Function that adds a new view to the view table with the corresponding name and value (view query); set\_id is optional, if it's not set, the system will determine the new id automatically.

int AK\_view\_remove\_by\_name (char \*name)

Function that removes the view by its name by identifying the view's id and passing id to AK\_view\_remove\_by\_obj\_id.

• int AK\_view\_rename (char \*name, char \*new\_name)

Function that renames a view (based on it's name) from "name" to "new\_name".

• int AK\_view\_change\_query (char \*name, char \*query, char \*rel\_exp)

Function that changes the query from a view (determined by it's name) to "query".

TestResult AK\_view\_test ()

A testing function for view.c functions.

char \* AK\_get\_view\_query (char \*name)

Function that returns a query by its name.

### 7.113.1 Function Documentation

## 7.113.1.1 AK\_check\_view\_name()

Function that checks if the name of the view already exists in AK\_view table.

**Author** 

Sara Kisic

**Parameters** 

name Name of the view

Returns

EXIT\_ERROR if the name already exists or name

## 7.113.1.2 AK\_get\_view\_query()

Function that returns a query by its name.

## Author

Danko Sačer

#### **Parameters**

name	name of the view
------	------------------

#### Returns

```
query string or EXIT_ERROR
```

## 7.113.1.3 AK\_view\_add()

Function that adds a new view to the view table with the corresponding name and value (view query); set\_id is optional, if it's not set, the system will determine the new id automatically.

#### Author

Kresimir Ivkovic

#### **Parameters**

name	name og the view	
query	query of the view	
rel_exp	xp relation expression of the view	
set_id	id of view	

#### Returns

Id of the newly inserted view

## 7.113.1.4 AK\_view\_change\_query()

Function that changes the query from a view (determined by it's name) to "query".

#### Author

Kresimir Ivkovic

#### **Parameters**

name	of the query
query	new query of the view
rel_exp	relation expression of the view

## Returns

error or success

## 7.113.1.5 AK\_view\_remove\_by\_name()

Function that removes the view by its name by identifying the view's id and passing id to AK\_view\_remove\_by\_\cdots obj\_id.

### Author

Kresimir Ivkovic

#### **Parameters**

name	name of the view
------	------------------

## Returns

Result of AK\_view\_remove\_by\_obj\_id or EXIT\_ERROR if no id is found

Function that removes the view by its name by identifying the view's id and passing id to AK\_view\_remove\_by\_
obj\_id.

#### **Author**

Kresimir Ivkovic

name name of the view
-----------------------

#### Returns

Result of AK\_view\_remove\_by\_object\_id or EXIT\_ERROR if no id is found

## 7.113.1.6 AK\_view\_rename()

Function that renames a view (based on it's name) from "name" to "new\_name".

Author

Kresimir Ivkovic

#### **Parameters**

name	name of the view
new_name	new name of the view

## Returns

error or success

## 7.113.1.7 AK\_view\_test()

```
TestResult AK_view_test ( )
```

A testing function for view.c functions.

Author

Kresimir Ivkovic, updated by Lidija Lastavec

# 7.114 tools/comments.py File Reference

## **Namespaces**

comments

## **Functions**

· def comments.getcommentsFiles ()

This function is searching for file that ends with either .py extension or .c extension and appending the same in constant cFiles/pyFiles.

· def comments.detectLanguage ()

Function is detecting language (is it croatian or alike) of a newly created commentsFile.

• def comments.makeCommentsFile ()

Function is parsing comments from file with .c extension and .py extension.

#### **Variables**

- string comments.commentsFile = "all\_comments.tmp"
- list comments.cFiles = []
- list comments.pyFiles = []

# 7.115 tools/getFiles.sh File Reference

## 7.115.1 Detailed Description

Finding all files that ends with extension .py or .c and storing them into file.txt

## 7.116 tools/parseC.sh File Reference

## 7.116.1 Detailed Description

Parsing every C file

## 7.117 tools/parsePy.sh File Reference

## 7.117.1 Detailed Description

Parsing every Py file

## 7.118 tools/updateVersion.sh File Reference

## 7.118.1 Detailed Description

Updating project version

## 7.119 trans/transaction.c File Reference

```
#include "transaction.h"
#include "../auxi/ptrcontainer.h"
Include dependency graph for transaction.c:
```

#### **Functions**

int AK\_memory\_block\_hash (int blockMemoryAddress)

Function that calculates the hash value for a given memory address. Hash values are used to identify location of locked resources.

AK\_transaction\_elem\_P AK\_search\_existing\_link\_for\_hook (int blockAddress)

Function that searches for a existing entry in hash list of active blocks.

AK\_transaction\_elem\_P AK\_search\_empty\_link\_for\_hook (int blockAddress)

Function that searches for a empty link for new active block, helper method in case of address collision.

AK\_transaction\_elem\_P AK\_add\_hash\_entry\_list (int blockAddress, int type)

Function that adds an element to the doubly linked list.

int AK\_delete\_hash\_entry\_list (int blockAddress)

Function that deletes a specific element in the lockTable doubly linked list.

 AK\_transaction\_lock\_elem\_P AK\_search\_lock\_entry\_list\_by\_key (AK\_transaction\_elem\_P Lockslist, int memoryAddress, pthread\_t id)

Function that searches for a specific entry in the Locks doubly linked list using the transaction id as it's key.

int AK\_delete\_lock\_entry\_list (int blockAddress, pthread\_t id)

Function that deletes a specific entry in the Locks doubly linked list using the transaction id as it's key.

int AK\_isLock\_waiting (AK\_transaction\_elem\_P lockHolder, int type, pthread\_t transactionId, AK\_transaction\_lock\_elem\_P lock)

Function that, based on the parameters, puts an transaction action in waiting phase or let's the transaction do it's actions.

AK\_transaction\_lock\_elem\_P AK\_add\_lock (AK\_transaction\_elem\_P HashList, int type, pthread\_

 t transactionId)

Function that adds an element to the locks doubly linked list.

AK\_transaction\_lock\_elem\_P AK\_create\_lock (int blockAddress, int type, pthread\_t transactionId)

Helper function that determines if there is a hash LockTable entry that corresponds to the given memory address. And if there isn't an entry the function calls for the creation of the Locks list holder.

int AK\_acquire\_lock (int memoryAddress, int type, pthread\_t transactionId)

Main interface function for the transaction API. It is responsible for the whole process of creating a new lock.

void AK release locks (AK memoryAddresses link addressesTmp, pthread t transactionId)

Main interface function for the transaction API. It is responsible for the whole process releasing locks acquired by a transaction. The locks are released either by COMMIT or ABORT.

int AK\_get\_memory\_blocks (char \*tblName, AK\_memoryAddresses\_link addressList)

Function that appends all addresses affected by the transaction.

int AK\_execute\_commands (command \*commandArray, int lengthOfArray)

Function that is called in a separate thread that is responsible for acquiring locks, releasing them and finding the associated block addresses.

void \* AK execute transaction (void \*params)

Function that is the thread start point all relevant functions. It acts as an intermediary between the main thread and other threads.

int AK\_remove\_transaction\_thread (pthread\_t transaction\_thread)

Function for deleting one of active threads from array of all active transactions threads.

• int AK\_create\_new\_transaction\_thread (AK\_transaction\_data \*transaction\_data)

Function for creating new thread. Function also adds thread ID to pthread\_t array.

• int AK\_transaction\_manager (command \*commandArray, int lengthOfArray)

Function that receives all the data and gives an id to that data and starts a thread that executes the transaction.

int AK\_transaction\_register\_observer (AK\_observable\_transaction \*observable\_transaction, AK\_observer \*observer)

Function for registering new observer of AK\_observable\_transaction type.

int AK\_transaction\_unregister\_observer (AK\_observable\_transaction \*observable\_transaction, AK\_observer \*observer)

Function for unregistering observer from AK observable transction type.

void handle\_transaction\_notify (AK\_observer\_lock \*observer\_lock)

Function for handling AK\_observable\_transaction notify. Function is associated to some observer instance.

void AK on observable notify (void \*observer, void \*observable, AK ObservableType Enum type)

Function for handling notify from some observable type.

void AK\_on\_transaction\_end (pthread\_t transaction\_thread)

Function for handling event when some transaction is finished.

void AK\_on\_all\_transactions\_end ()

Function for handling event when all transactions are finished.

void AK\_on\_lock\_release ()

Function for handling event when one of lock is released.

void AK\_handle\_observable\_transaction\_action (NoticeType \*noticeType)

Function for handling action which is called from observable\_transaction type.

void AK lock released ()

Function which is called when the lock is released.

· void AK\_transaction\_finished ()

Function that is called when some transaction is finished.

· void AK all transactions finished ()

Function that is called when all transactions are finished.

AK\_observable\_transaction \* AK\_init\_observable\_transaction ()

Function for initialization of AK\_observable\_transaction type.

AK\_observer\_lock \* AK\_init\_observer\_lock ()

Function for initialization of AK\_observer\_lock type.

• TestResult AK\_test\_Transaction ()

### **Variables**

- AK\_transaction\_list LockTable [NUMBER\_OF\_KEYS]
- pthread\_mutex\_t accessLockMutex = PTHREAD\_MUTEX\_INITIALIZER
- pthread\_mutex\_t acquireLockMutex = PTHREAD\_MUTEX\_INITIALIZER
- pthread\_mutex\_t newTransactionLockMutex = PTHREAD\_MUTEX\_INITIALIZER
- pthread\_mutex\_t endTransationTestLockMutex = PTHREAD\_MUTEX\_INITIALIZER
- pthread\_cond\_t cond\_lock = PTHREAD\_COND\_INITIALIZER
- PtrContainer observable\_transaction
- pthread\_t activeThreads [MAX\_ACTIVE\_TRANSACTIONS\_COUNT]
- int activeTransactionsCount = 0
- int transactionsCount = 0

### 7.119.1 Detailed Description

Defines functions for transaction execution

### 7.119.2 Function Documentation

### 7.119.2.1 AK\_acquire\_lock()

Main interface function for the transaction API. It is responsible for the whole process of creating a new lock.

### **Author**

Frane Jakelić updated by Ivan Pusic

**Todo** Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

#### **Parameters**

memoryAddress integer representation of memory address.	
type	of lock issued to the provided memory address.
transactionId	integer representation of transaction id.

### Returns

OK or NOT\_OK based on the success of the function.

#######\n# Lock Granted after wait#\n#------#\n# Lock ID:lu TYPE:i #\n#------#\n# LockedAddress:i #\n#################\n\n", (unsigned long)lock->TransactionId, lock-lock\_type, memoryAddress); \*/

##########\n# Lock Granted #\n#-------#\n# Lock ID:lu TYPE:i #\n#-----------#\n# LockedAddress:i #\n##############\n\n", (unsigned long)lock->TransactionId, lock->lock\_type, memoryAddress); \*/

### 7.119.2.2 AK\_add\_hash\_entry\_list()

Function that adds an element to the doubly linked list.

### Author

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
type	of lock issued to the provided memory address.

### Returns

pointer to the newly created doubly linked element.

# 7.119.2.3 AK\_add\_lock()

Function that adds an element to the locks doubly linked list.

### **Author**

Frane Jakelić

# **Parameters**

memoryAddress	integer representation of memory address.	
type	of lock issued to the provided memory address.	
transactionId	integer representation of transaction id.	

### Returns

pointer to the newly created Locks doubly linked element.

### 7.119.2.4 AK\_all\_transactions\_finished()

```
void AK_all_transactions_finished ( )
```

Function that is called when all transactions are finished.

### Author

Ivan Pusic

# 7.119.2.5 AK\_create\_lock()

```
AK_transaction_lock_elem_P AK_create_lock (
          int blockAddress,
          int type,
          pthread_t transactionId )
```

Helper function that determines if there is a hash LockTable entry that corresponds to the given memory address. And if there isn't an entry the function calls for the creation of the Locks list holder.

### Author

Frane Jakelić

### **Parameters**

memoryAddress	integer representation of memory address.	
type	of lock issued to the provided memory address.	
transactionId integer representation of transaction id.		

### Returns

pointer to the newly created Locks doubly linked element.

### 7.119.2.6 AK\_create\_new\_transaction\_thread()

Function for creating new thread. Function also adds thread ID to pthread\_t array.

# Author

Ivan Pusic

# **Parameters**

transaction_data	Data for executing transaction
------------------	--------------------------------

### Returns

Exit status (OK or NOT OK)

# 7.119.2.7 AK\_delete\_hash\_entry\_list()

Function that deletes a specific element in the lockTable doubly linked list.

**Author** 

Frane Jakelić

### **Parameters**

dress integer representation of memo	ory address.
--------------------------------------	--------------

### Returns

integer OK or NOT\_OK based on success of finding the specific element in the list.

### 7.119.2.8 AK\_delete\_lock\_entry\_list()

Function that deletes a specific entry in the Locks doubly linked list using the transaction id as it's key.

### Author

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
id	integer representation of transaction id.

### Returns

int OK or NOT\_OK based on success of finding the specific element in the list.

# 7.119.2.9 AK\_execute\_commands()

Function that is called in a separate thread that is responsible for acquiring locks, releasing them and finding the associated block addresses.

### Author

Frane Jakelić updated by Ivan Pusic

Todo Check multithreading, check if it's working correctly

### **Parameters**

commandArray	commandArray array filled with commands that need to be secured using transaction	
lengthOfArray	lengthOfArray length of commandArray	
transactionId	associated with the transaction	

### Returns

ABORT or COMMIT based on the success of the function.

### 7.119.2.10 AK\_execute\_transaction()

Function that is the thread start point all relevant functions. It acts as an intermediary between the main thread and other threads.

## Author

Frane Jakelić updated by Ivan Pusic

### **Parameters**

### 7.119.2.11 AK\_get\_memory\_blocks()

Function that appends all addresses affected by the transaction.

### Author

Frane Jakelić

### **Parameters**

addressList	pointer to the linked list where the addresses are stored.
tblName	table name used in the transaction

### Returns

OK or NOT\_OK based on the success of the function.

# 7.119.2.12 AK\_handle\_observable\_transaction\_action()

Function for handling action which is called from observable\_transaction type.

# Author

Ivan Pusic

### **Parameters**

noticeType	Type of action (event)	_
nonoc type	Type of dollors (overst)	

# 7.119.2.13 AK\_init\_observable\_transaction()

```
{\tt AK\_observable\_transaction* AK\_init\_observable\_transaction \ (\ )}
```

Function for initialization of AK\_observable\_transaction type.

### **Author**

Ivan Pusic

### Returns

Pointer to new AK\_observable\_transaction instance

# 7.119.2.14 AK\_init\_observer\_lock()

```
AK_observer_lock* AK_init_observer_lock ( )
```

Function for initialization of AK\_observer\_lock type.

**Author** 

Ivan Pusic

### Returns

Pointer to new AK\_observer\_lock instance

# 7.119.2.15 AK\_isLock\_waiting()

Function that, based on the parameters, puts an transaction action in waiting phase or let's the transaction do it's actions.

### Author

Frane Jakelić updated by Ivan Pusic

# **Parameters**

lockHolder	pointer to the hash list entry that is entitled to the specific memory address.
type	of lock issued to the provided memory address.
transaction⊷ Id	integer representation of transaction id.
lock	pointer to the lock element that is being tested.

# Returns

int PASS\_LOCK\_QUEUE or WAIT\_FOR\_UNLOCK based on the rules described inside the function.

### 7.119.2.16 AK lock released()

```
void AK_lock_released ( )
```

Function which is called when the lock is released.

Author

Ivan Pusic

## 7.119.2.17 AK\_memory\_block\_hash()

```
int AK_memory_block_hash (
          int blockMemoryAddress )
```

Function that calculates the hash value for a given memory address. Hash values are used to identify location of locked resources.

**Author** 

Frane Jakelić

**Todo** The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

### **Parameters**

blockMemoryAddress	integer representation of memory address, the hash value is calculated from this	
	parameter.	

### Returns

integer containing the hash value of the passed memory address

# 7.119.2.18 AK\_on\_all\_transactions\_end()

```
void AK_on_all_transactions_end ( )
```

Function for handling event when all transactions are finished.

**Author** 

Ivan Pusic

### 7.119.2.19 AK\_on\_lock\_release()

```
void AK_on_lock_release ( )
```

Function for handling event when one of lock is released.

Author

Ivan Pusic

# 7.119.2.20 AK\_on\_observable\_notify()

Function for handling notify from some observable type.

**Author** 

Ivan Pusic

### **Parameters**

observer	Observer type	
observable	Observable type	
type	Type of observable who sent some notice	

### 7.119.2.21 AK\_on\_transaction\_end()

Function for handling event when some transaction is finished.

**Author** 

Ivan Pusic

### **Parameters**

transaction_thread	Thread ID of transaction which is finished
--------------------	--

## 7.119.2.22 AK\_release\_locks()

Main interface function for the transaction API. It is responsible for the whole process releasing locks acquired by a transaction. The locks are released either by COMMIT or ABORT .

Author

Frane Jakelić updated by Ivan Pusic

### **Parameters**

adresses	linked list of memory addresses locked by the transaction.	
transaction←	integer representation of transaction id.	
ld		

### 7.119.2.23 AK\_remove\_transaction\_thread()

Function for deleting one of active threads from array of all active transactions threads.

**Author** 

Ivan Pusic

### **Parameters**

transaction_thread	Active thread to delete
--------------------	-------------------------

### Returns

Exit status (OK or NOT\_OK)

# 7.119.2.24 AK\_search\_empty\_link\_for\_hook()

Function that searches for a empty link for new active block, helper method in case of address collision.

**Author** 

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
--------------	---

### Returns

pointer to empty location to store new active address

# 7.119.2.25 AK\_search\_existing\_link\_for\_hook()

Function that searches for a existing entry in hash list of active blocks.

**Author** 

Frane Jakelić

### **Parameters**

blockAddress integer rep	resentation of memory address.
--------------------------	--------------------------------

### Returns

pointer to the existing hash list entry

# 7.119.2.26 AK\_search\_lock\_entry\_list\_by\_key()

Function that searches for a specific entry in the Locks doubly linked list using the transaction id as it's key.

**Author** 

Frane Jakelić

### **Parameters**

memoryAddress	integer representation of memory address.
id	integer representation of transaction id.

### Returns

NULL pointer if the element is not found otherwise it returns a pointer to the found element

### 7.119.2.27 AK\_test\_Transaction()

```
TestResult AK_test_Transaction ( )
```

# 7.119.2.28 AK\_transaction\_finished()

```
void AK\_transaction\_finished ( )
```

Function that is called when some transaction is finished.

**Author** 

Ivan Pusic

# 7.119.2.29 AK\_transaction\_manager()

Function that receives all the data and gives an id to that data and starts a thread that executes the transaction.

**Author** 

Frane Jakelić updated by Ivan Pusic

### **Parameters**

commandArray	array filled with commands that need to be secured using transactions	
lengthOfArray	length of commandArray	

# 7.119.2.30 AK\_transaction\_register\_observer()

Function for registering new observer of AK\_observable\_transaction type.

Author

Ivan Pusic

### **Parameters**

observable_transaction	Observable type instance
observer	Observer instance

### Returns

Exit status (OK or NOT\_OK)

# 7.119.2.31 AK\_transaction\_unregister\_observer()

Function for unregistering observer from AK\_observable\_transction type.

Author

Ivan Pusic

### **Parameters**

observable_transaction	Observable type instance
observer	Observer instance

### Returns

Exit status (OK or NOT\_OK)

# 7.119.2.32 handle\_transaction\_notify()

```
void handle_transaction_notify ( {\tt AK\_observer\_lock * observer\_lock })
```

Function for handling AK\_observable\_transaction notify. Function is associated to some observer instance.

Author

Ivan Pusic

# **Parameters**

observer_lock	Observer type instance
---------------	------------------------

# 7.119.3 Variable Documentation

### 7.119.3.1 accessLockMutex

```

Include dependency graph for transaction.h: This graph shows which files directly or indirectly include this file:

# **Classes**

- · struct observable\_transaction\_struct
- struct observer\_lock

Structure which defines transaction lock observer type.

struct transaction\_locks\_list\_elem

Structure that represents LockTable entry about transaction resource lock.

struct transaction\_list\_elem

Structure that represents LockTable entry about transaction lock holder. Element indexed by Hash table.

· struct transaction\_list\_head

Structure that represents LockTable entry about doubly linked list of collision in Hash table.

• struct memoryAddresses

Structure that represents a linked list of locked addresses.

· struct transactionData

Structure used to transport transaction data to the thread.

· struct threadContainer

Structure that represents a linked list of threads.

# **Typedefs**

- typedef struct observable\_transaction\_struct AK\_observable\_transaction
- · typedef struct observer lock AK observer lock
- typedef struct transactionData AK\_transaction\_data
- typedef struct memoryAddresses AK memoryAddresses
- typedef struct memoryAddresses \* AK\_memoryAddresses\_link
- typedef struct transaction\_list\_head AK\_transaction\_list
- typedef struct transaction list elem \* AK transaction elem P
- typedef struct transaction list elem AK transaction elem
- typedef struct transaction locks list elem \* AK transaction lock elem P
- typedef struct transaction locks list elem AK transaction lock elem
- typedef struct threadContainer \* AK\_thread\_elem
- typedef struct threadContainer AK thread Container

### **Enumerations**

enum NoticeType { AK\_LOCK\_RELEASED, AK\_TRANSACTION\_FINISHED, AK\_ALL\_TRANSACTION\_FINISHED }

Enumeration which define notice types for transactions.

### **Functions**

· int AK memory block hash (int)

Function that calculates the hash value for a given memory address. Hash values are used to identify location of locked resources.

AK\_transaction\_elem\_P AK\_search\_existing\_link\_for\_hook (int)

Function that searches for a existing entry in hash list of active blocks.

· AK transaction elem P AK search empty link for hook (int)

Function that searches for a empty link for new active block, helper method in case of address collision.

AK\_transaction\_elem\_P AK\_add\_hash\_entry\_list (int, int)

Function that adds an element to the doubly linked list.

int AK\_delete\_hash\_entry\_list (int)

Function that deletes a specific element in the lockTable doubly linked list.

AK\_transaction\_lock\_elem\_P AK\_search\_lock\_entry\_list\_by\_key (AK\_transaction\_elem\_P, int, pthread\_t)

Function that searches for a specific entry in the Locks doubly linked list using the transaction id as it's key.

• int AK delete lock entry list (int, pthread t)

Function that deletes a specific entry in the Locks doubly linked list using the transaction id as it's key.

int AK\_isLock\_waiting (AK\_transaction\_elem\_P, int, pthread\_t, AK\_transaction\_lock\_elem\_P)

Function that, based on the parameters, puts an transaction action in waiting phase or let's the transaction do it's actions.

AK\_transaction\_lock\_elem\_P AK\_add\_lock (AK\_transaction\_elem\_P, int, pthread\_t)

Function that adds an element to the locks doubly linked list.

AK\_transaction\_lock\_elem\_P AK\_create\_lock (int, int, pthread\_t)

Helper function that determines if there is a hash LockTable entry that corresponds to the given memory address. And if there isn't an entry the function calls for the creation of the Locks list holder.

int AK\_acquire\_lock (int, int, pthread\_t)

Main interface function for the transaction API. It is responsible for the whole process of creating a new lock.

void AK release locks (AK memoryAddresses link, pthread t)

Main interface function for the transaction API. It is responsible for the whole process releasing locks acquired by a transaction. The locks are released either by COMMIT or ABORT.

• int AK\_get\_memory\_blocks (char \*, AK\_memoryAddresses\_link)

Function that appends all addresses affected by the transaction.

int AK execute commands (command \*, int)

Function that is called in a separate thread that is responsible for acquiring locks, releasing them and finding the associated block addresses.

void \* AK execute transaction (void \*)

Function that is the thread start point all relevant functions. It acts as an intermediary between the main thread and other threads.

int AK transaction manager (command \*, int)

Function that receives all the data and gives an id to that data and starts a thread that executes the transaction.

- TestResult AK test Transaction ()
- int AK\_create\_new\_transaction\_thread (AK\_transaction\_data \*)

Function for creating new thread. Function also adds thread ID to pthread\_t array.

int AK\_remove\_transaction\_thread (pthread\_t)

Function for deleting one of active threads from array of all active transactions threads.

void handle\_transaction\_notify (AK\_observer\_lock \*)

Function for handling AK observable transaction notify. Function is associated to some observer instance.

void AK on observable notify (void \*, void \*, AK ObservableType Enum)

Function for handling notify from some observable type.

void AK\_on\_transaction\_end (pthread\_t)

Function for handling event when some transaction is finished.

void AK\_on\_lock\_release ()

Function for handling event when one of lock is released.

void AK\_on\_all\_transactions\_end ()

Function for handling event when all transactions are finished.

void AK\_handle\_observable\_transaction\_action (NoticeType \*)

Function for handling action which is called from observable\_transaction type.

• void AK lock released ()

Function which is called when the lock is released.

• void AK transaction finished ()

Function that is called when some transaction is finished.

void AK\_all\_transactions\_finished ()

Function that is called when all transactions are finished.

int AK\_transaction\_register\_observer (AK\_observable\_transaction \*, AK\_observer \*)

Function for registering new observer of AK\_observable\_transaction type.

• int AK\_transaction\_unregister\_observer (AK\_observable\_transaction \*, AK\_observer \*)

Function for unregistering observer from AK observable transction type.

AK\_observable\_transaction \* AK\_init\_observable\_transaction ()

Function for initialization of AK\_observable\_transaction type.

• AK\_observer\_lock \* AK\_init\_observer\_lock ()

Function for initialization of AK\_observer\_lock type.

### 7.120.1 Detailed Description

Header file that contains data structures functions and defines for the transaction execution

### 7.120.2 Typedef Documentation

# 7.120.2.1 AK\_memoryAddresses

typedef struct memoryAddresses AK\_memoryAddresses

# 7.120.2.2 AK\_memoryAddresses\_link

typedef struct memoryAddresses\* AK\_memoryAddresses\_link

# 7.120.2.3 AK\_observable\_transaction

 ${\tt typedef \ struct \ observable\_transaction\_struct \ AK\_observable\_transaction}$ 

### 7.120.2.4 AK\_observer\_lock

typedef struct observer\_lock AK\_observer\_lock

# 7.120.2.5 AK\_thread\_Container

 ${\tt typedef\ struct\ threadContainer\ AK\_thread\_Container}$ 

### 7.120.2.6 AK\_thread\_elem

typedef struct threadContainer\* AK\_thread\_elem

# 7.120.2.7 AK\_transaction\_data

# 7.120.2.11 AK\_transaction\_lock\_elem

typedef struct transaction\_locks\_list\_elem AK\_transaction\_lock\_elem

# 7.120.2.12 AK\_transaction\_lock\_elem\_P

typedef struct transaction\_locks\_list\_elem\* AK\_transaction\_lock\_elem\_P

# 7.120.3 Enumeration Type Documentation

### 7.120.3.1 NoticeType

enum NoticeType

Enumeration which define notice types for transactions.

Author

Ivan Pusic

### Enumerator

AK_LOCK_RELEASED	
AK_TRANSACTION_FINISHED	
AK_ALL_TRANSACTION_FINISHED	

# 7.120.4 Function Documentation

# 7.120.4.1 AK\_acquire\_lock()

Main interface function for the transaction API. It is responsible for the whole process of creating a new lock.

### **Author**

Frane Jakelić updated by Ivan Pusic

**Todo** Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

### **Parameters**

memoryAddress	integer representation of memory address.
type	of lock issued to the provided memory address.
transactionId	integer representation of transaction id.

### Returns

OK or NOT\_OK based on the success of the function.

### **Author**

Frane Jakelić updated by Ivan Pusic

**Todo** Implement a better deadlock detection. This method uses a very simple approach. It waits for 60sec before it restarts a transaction.

### **Parameters**

memoryAddress	integer representation of memory address.
type	of lock issued to the provided memory address.
transactionId	integer representation of transaction id.

### Returns

OK or NOT\_OK based on the success of the function.

#######\n# Lock Granted after wait#\n#------#\n# Lock ID:lu TYPE:i #\n#---------#\n# LockedAddress:i #\n#################\n\n", (unsigned long)lock->TransactionId, lock->lock\_type, memoryAddress); \*/

###########\n# Lock Granted #\n#------#\n# Lock ID:lu TYPE:i #\n#------#\n# LockedAddress:i #\n#####################\n\n", (unsigned long)lock->TransactionId, lock->lock\_type, memoryAddress); \*/

### 7.120.4.2 AK\_add\_hash\_entry\_list()

Function that adds an element to the doubly linked list.

**Author** 

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
type	of lock issued to the provided memory address.

# Returns

pointer to the newly created doubly linked element.

### 7.120.4.3 AK\_add\_lock()

Function that adds an element to the locks doubly linked list.

**Author** 

Frane Jakelić

### **Parameters**

memoryAddress	integer representation of memory address.
type	of lock issued to the provided memory address.
transactionId	integer representation of transaction id.

### Returns

pointer to the newly created Locks doubly linked element.

## 7.120.4.4 AK\_all\_transactions\_finished()

```
void AK_all_transactions_finished ( )
```

Function that is called when all transactions are finished.

**Author** 

Ivan Pusic

### 7.120.4.5 AK\_create\_lock()

Helper function that determines if there is a hash LockTable entry that corresponds to the given memory address. And if there isn't an entry the function calls for the creation of the Locks list holder.

# Author

Frane Jakelić

# Parameters

memoryAddress	integer representation of memory address.
type	of lock issued to the provided memory address.
transactionId	integer representation of transaction id.

# Returns

pointer to the newly created Locks doubly linked element.

# 7.120.4.6 AK\_create\_new\_transaction\_thread()

Function for creating new thread. Function also adds thread ID to pthread\_t array.

### Author

Ivan Pusic

### **Parameters**

transaction_data	Data for executing transaction
------------------	--------------------------------

### Returns

Exit status (OK or NOT\_OK)

# 7.120.4.7 AK\_delete\_hash\_entry\_list()

Function that deletes a specific element in the lockTable doubly linked list.

### Author

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
--------------	---

# Returns

integer OK or NOT\_OK based on success of finding the specific element in the list.

# 7.120.4.8 AK\_delete\_lock\_entry\_list()

Function that deletes a specific entry in the Locks doubly linked list using the transaction id as it's key.

### **Author**

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
id	integer representation of transaction id.

### Returns

int OK or NOT\_OK based on success of finding the specific element in the list.

# 7.120.4.9 AK\_execute\_commands()

Function that is called in a separate thread that is responsible for acquiring locks, releasing them and finding the associated block addresses.

### **Author**

Frane Jakelić updated by Ivan Pusic

Todo Check multithreading, check if it's working correctly

### **Parameters**

commandArray	array filled with commands that need to be secured using transactions
lengthOfArray	length of commandArray
transactionId	associated with the transaction

### Returns

ABORT or COMMIT based on the success of the function.

### **Author**

Frane Jakelić updated by Ivan Pusic

Todo Check multithreading, check if it's working correctly

### **Parameters**

commandArray	array filled with commands that need to be secured using transactions
lengthOfArray	length of commandArray
transactionId	associated with the transaction

### Returns

ABORT or COMMIT based on the success of the function.

# 7.120.4.10 AK\_execute\_transaction()

Function that is the thread start point all relevant functions. It acts as an intermediary between the main thread and other threads.

### **Author**

Frane Jakelić updated by Ivan Pusic

### **Parameters**

data transmitted to the thread from the main thread

# 7.120.4.11 AK\_get\_memory\_blocks()

Function that appends all addresses affected by the transaction.

### Author

Frane Jakelić

### **Parameters**

addressList	pointer to the linked list where the addresses are stored.
tblName	table name used in the transaction

# Returns

OK or NOT\_OK based on the success of the function.

# 7.120.4.12 AK\_handle\_observable\_transaction\_action()

Function for handling action which is called from observable\_transaction type.

**Author** 

Ivan Pusic

### **Parameters**

notice lype   Type of action (event)	noticeType	Type of action (event)
--------------------------------------	------------	------------------------

## 7.120.4.13 AK\_init\_observable\_transaction()

```
AK_observable_transaction* AK_init_observable_transaction ( )
```

Function for initialization of AK\_observable\_transaction type.

**Author** 

Ivan Pusic

Returns

Pointer to new AK\_observable\_transaction instance

# 7.120.4.14 AK\_init\_observer\_lock()

```
AK_observer_lock* AK_init_observer_lock ( )
```

Function for initialization of AK\_observer\_lock type.

Author

Ivan Pusic

Returns

Pointer to new AK\_observer\_lock instance

# 7.120.4.15 AK\_isLock\_waiting()

Function that, based on the parameters, puts an transaction action in waiting phase or let's the transaction do it's actions.

### **Author**

Frane Jakelić updated by Ivan Pusic

### **Parameters**

lockHolder	pointer to the hash list entry that is entitled to the specific memory address.
type	of lock issued to the provided memory address.
transaction←	integer representation of transaction id.
Id	
lock	pointer to the lock element that is being tested.

### Returns

int PASS\_LOCK\_QUEUE or WAIT\_FOR\_UNLOCK based on the rules described inside the function.

# 7.120.4.16 AK\_lock\_released()

```
void AK_lock_released ( )
```

Function which is called when the lock is released.

### **Author**

Ivan Pusic

### 7.120.4.17 AK\_memory\_block\_hash()

```
\label{lock_memory_block_hash} \mbox{int } \mbox{blockMemoryAddress })
```

Function that calculates the hash value for a given memory address. Hash values are used to identify location of locked resources.

### **Author**

Frane Jakelić

**Todo** The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

### **Parameters**

blockMemoryAddress	integer representation of memory address, the hash value is calculated from this
	parameter.

### Returns

integer containing the hash value of the passed memory address

### Author

Frane Jakelić

**Todo** The current implementation is very limited it doesn't cope well with collision. recommendation use some better version of hash calculation. Maybe Knuth's memory address hashing function.

### **Parameters**

blockMemoryAddress	integer representation of memory address, the hash value is calculated from this
	parameter.

### Returns

integer containing the hash value of the passed memory address

## 7.120.4.18 AK\_on\_all\_transactions\_end()

```
void AK_on_all_transactions_end ( )
```

Function for handling event when all transactions are finished.

### Author

Ivan Pusic

### 7.120.4.19 AK\_on\_lock\_release()

```
void AK_on_lock_release ( )
```

Function for handling event when one of lock is released.

### **Author**

Ivan Pusic

# 7.120.4.20 AK\_on\_observable\_notify()

Function for handling notify from some observable type.

**Author** 

Ivan Pusic

### **Parameters**

observer	Observer type
observable	Observable type
type	Type of observable who sent some notice

### 7.120.4.21 AK\_on\_transaction\_end()

```
void AK_on_transaction_end ( {\tt pthread\_t~transaction\_thread~)}
```

Function for handling event when some transaction is finished.

**Author** 

Ivan Pusic

### **Parameters**

transaction_thread	Thread ID of transaction which is finished
--------------------	--

### 7.120.4.22 AK\_release\_locks()

Main interface function for the transaction API. It is responsible for the whole process releasing locks acquired by a transaction. The locks are released either by COMMIT or ABORT .

Author

Frane Jakelić updated by Ivan Pusic

### **Parameters**

adresses	linked list of memory addresses locked by the transaction.
transaction←	integer representation of transaction id.
ld	

### 7.120.4.23 AK\_remove\_transaction\_thread()

Function for deleting one of active threads from array of all active transactions threads.

**Author** 

Ivan Pusic

### **Parameters**

transaction_thread	Active thread to delete
--------------------	-------------------------

### Returns

Exit status (OK or NOT\_OK)

# 7.120.4.24 AK\_search\_empty\_link\_for\_hook()

Function that searches for a empty link for new active block, helper method in case of address collision.

**Author** 

Frane Jakelić

### **Parameters**

blockAddress	integer representation of memory address.
--------------	---

### Returns

pointer to empty location to store new active address

# 7.120.4.25 AK\_search\_existing\_link\_for\_hook()

Function that searches for a existing entry in hash list of active blocks.

**Author** 

Frane Jakelić

### **Parameters**

blockAddress integer rep	resentation of memory address.
--------------------------	--------------------------------

### Returns

pointer to the existing hash list entry

### 7.120.4.26 AK\_search\_lock\_entry\_list\_by\_key()

Function that searches for a specific entry in the Locks doubly linked list using the transaction id as it's key.

**Author** 

Frane Jakelić

### **Parameters**

memoryAddress	integer representation of memory address.
id	integer representation of transaction id.

### Returns

NULL pointer if the element is not found otherwise it returns a pointer to the found element

### 7.120.4.27 AK\_test\_Transaction()

```
TestResult AK_test_Transaction ( )
```

### 7.120.4.28 AK\_transaction\_finished()

```
void AK\_transaction\_finished ( )
```

Function that is called when some transaction is finished.

**Author** 

Ivan Pusic

### 7.120.4.29 AK\_transaction\_manager()

Function that receives all the data and gives an id to that data and starts a thread that executes the transaction.

**Author** 

Frane Jakelić updated by Ivan Pusic

### **Parameters**

commandArray	array filled with commands that need to be secured using transactions
lengthOfArray	length of commandArray

# 7.120.4.30 AK\_transaction\_register\_observer()

```
int AK_transaction_register_observer (  AK\_observable\_transaction * observable\_transaction, \\ AK\_observer * observer )
```

Function for registering new observer of AK\_observable\_transaction type.

Author

Ivan Pusic

### **Parameters**

observable_transaction	Observable type instance
observer	Observer instance

### Returns

Exit status (OK or NOT\_OK)

# 7.120.4.31 AK\_transaction\_unregister\_observer()

Function for unregistering observer from AK\_observable\_transction type.

Author

Ivan Pusic

### **Parameters**

observable_transaction	Observable type instance
observer	Observer instance

### Returns

Exit status (OK or NOT\_OK)

# 7.120.4.32 handle\_transaction\_notify()

```
void handle_transaction_notify ( {\tt AK\_observer\_lock} \ * \ observer\_lock \ )
```

Function for handling AK\_observable\_transaction notify. Function is associated to some observer instance.

Author

Ivan Pusic

# **Parameters**

observer_lock	Observer type instance
---------------	------------------------
